ONTARIO PROJECT UPDATE

Vancouver, December 10, 2007 – Portrush Petroleum Corporation (the “Company”) announces that the Portrush et al # 1, Moore 5-13-III well was drilled to a final total depth of 729.0m. on December 6, 2007 without encountering a pinnacle reef. The well encountered a number of “reef proximity indicators” including two zones of reef derived “Sucrosic Dolomite” in the upper A1 Carbonate formation. The lower zone with 11.8’ of thickness gave up good oil showings while drilling. The Neutron-Density logs indicate porosity in the 6.0% range but with poor permeability and not suitable for completion. “Fracturing stimulation” is not allowed on wells that are drilled adjacent to gas storage reservoirs so this was not an option for the Company.

The well is considered a near miss of a pinnacle reef. The 2D Seismic anomaly on which it was drilled is considered “sideswipe” to a pinnacle. The Company is planning a more sophisticated 3D Seismic survey over the lands to pinpoint a drillable anomaly. This survey might take place in February when the ground could be frozen. This would minimize land damages in a very sensitive area. The well is presently being saved in anticipation of directionally drilling in the direction of the pinnacle subject to the seismic results.

The prospect is on trend and mid point between two pinnacle reef gas storage pools, Kimball Colinville and Waubuno and it is favourably located with respect to a Union Gas Pipeline tie-in located on the Kimball Side Road approximately 1.55 miles from the prospect.

Scanio-Shelton # 8 is placed on production.

Vancouver, January 29, 2008 – Portrush Petroleum Corporation (TSX- V :PSH, OTCBB:PRRPF) (<http://www.portrushpetroleum.com>) wishes to provide an update regarding its continuing operations on the Scanio/Sheldon No.8 well in the Mission River property in Texas. The well has been drilled to a total depth of 8,600 feet and has been placed on production at an initial rate of half a million cubic feet of gas a day and approximately seventy five barrels of oil a day.

The well was the first well of a four well drilling project and the next location is under construction. It is intended to drill the next well as soon as a drilling rig comes available.

Preliminary production results, together with an in-depth analysis of log data obtained from the well suggest that the reserves are both oil and gas. The well has been placed on production without an upgrade to the existing facilities. A final interpretation of the overall hydrocarbon column encountered, and hence estimated reservoir volumes and a full analysis of all the log data and fluid sampling recovered from the well is currently being undertaken.

The Mission River lease is operated by McAlester and is located at the south end of the town of Refugio, Refugio County, Texas. The field has multiple pays at depths ranging from 2,000 to 8,500 feet. Portrush has a 10% working interest in the field. A further announcement will be made in due course regarding the additional drilling and any updates on the production rates

The Company has received a proposal to shoot a 3D seismic survey on the pinnacle reef prospect in Moore township, Lambton County, Southwestern Ontario. The prospect is located on trend and mid-point between two pinnacle reef gas storage pools, Kimball Colinville and Waubuno.

Portrush to develop Chico Martinez

Vancouver, February 4, 2008 – Portrush Petroleum Corporation wishes to announce that it has entered into an agreement to acquire and develop the Chico Martinez oil field Kern County, California.

The Chico Martinez Field is a 640 acre tract in the San Joaquin Basin, California. Two very productive formations are present in the Field: The Etchegoin formation is a heavy oil producer (average API is 12.1 degrees) present at depths between 400 and 1,500 feet and the Diatomite formation is present between 2,000 and 3,000 feet. Oil from the Diatomite averages 26 degrees API.

The field is located directly between the South Belridge Field and the Cymric Field

The Belridge South Field, a Two Billion Barrel Field, is two miles away to the North East and the Cymric Field, a 350 Million Barrel field, is two Miles to the South East. Both fields have significant daily oil production primarily from the Diatomite. Daily production rates from these fields are available on the California State website.

To date 62 wells have been drilled on the Chico Martinez property and the Field has already produced a total of approximately 550,000 Barrels of Oil from the Etchegoin Formation. The leases are held by production.

Portrush has entered into an agreement with the Houston based Petromark Energy Group to acquire a 90% interest in the leases. Both Companies will be co-operators of the Leases and will form a Joint Operating Agreement which shall govern the development and the operation of the Field.
