CARDIOME ANNOUNCES EXPANDED LABEL FOR AGGRASTAT® IN CHINA INCLUDING NEW STEMI INDICATION AND HIGH DOSE BOLUS REGIMEN

Addition of High-Risk STEMI Patients Significantly Expands the Number of Patients in Which Aggrastat Can Be Used

Vancouver, Canada, January 23, 2018 – Cardiome Pharma Corp. (NASDAQ:CRME / TSX:COM), a revenue-generating, specialty pharmaceutical company focused on commercializing patent-protected hospital drugs, today announced that the Chinese Center for Drug Evaluation (CDE) has approved an expansion of the indications for Aggrastat (tirofiban hydrochloride) to now, in addition to acute coronary syndromes without ST elevation (NSTEMI-ACS) include patients with ST-segment elevation myocardial infarction (STEMI), who are intended for primary percutaneous coronary intervention (PCI). In addition to the expanded indications, the CDE also approved an Aggrastat high dose bolus (HDB) regimen (25 mcg/kg over a 3-minute period, followed by continuous infusion of 0.15 mcg/kg/min for 12-24 hours and up to 48 hours) to be used on both indicated patient populations.

“This label expansion in China is a highly positive development for the Aggrastat franchise because it significantly expands the number of patients in which the drug can be used to now include both NSTEMI-ACS and STEMI patients,” commented Kiran Bhirangi, M.D., Cardiome’s Vice President, Clinical Development and Medical Affairs. “Identifying STEMI patients is done via a standard 12-lead ECG, so is therefore a fast, easy and cost-effective means to capturing these additional high-risk patients who stand to benefit from treatment with Aggrastat. The inclusion of the HDB regimen is also important because it aligns the Chinese posology with that used in the U.S., Europe and Canada and better reflects current clinical practice.”

In China, Aggrastat was previously indicated for use in patients with NSTEMI-ACS, as well as to prevent ischemic complications as a result of coronary angioplasty procedures. The new expanded label will include both STEMI and NSTEMI-ACS. Aggrastat is currently marketed by Cardiome in over 60 countries worldwide.

The Aggrastat HDB regimen will now become the recommended dose regimen to reduce the rate of refractory ischemic conditions, new myocardial infarction and death in both STEMI patients set to undergo PCI and NSTEMI-ACS patients who undergo early PCI. The CDE’s approval of the Aggrastat label expansion is based on results from several clinical trials demonstrating the tolerability, and risk reduction of myocardial infarction and death by Aggrastat when compared to placebo and other agents. These studies indicated that a higher degree of platelet inhibition was beneficial for patients in need of an urgent PCI, and thus at a high risk for ischemic events, and

that clinical benefit of the Aggrastat HDB was demonstrated in patients with NSTEMI-ACS who undergo early PCI, as well as in STEMI patients undergoing primary PCI. Cardiome's partner, Eddingpharm, markets and distributes Aggrastat in China and executes regulatory initiatives such as this label expansion.

About Acute Coronary Syndromes

Acute Coronary Syndromes (ACS) is a term that refers to a variety of conditions consistent with acute myocardial ischemia and/or infarction that are usually due to an abrupt reduction in coronary blood flow¹. The ACS spectrum includes patients with ST-elevation myocardial infarction (STEMI) and non-ST-elevation ACS (NSTEMI-ACS), which is comprised of non-STEMI (NSTEMI) and unstable angina. The thrombus (i.e. blood clot that forms inside a blood vessel or chamber of the heart) formation reduces blood flow in the affected coronary artery and causes ischemic chest pain¹. Research from Datamonitor estimates that in 2013, >880,000 persons in the US experienced an ACS event, while in the major five EU markets, this figure was >650,000.² Furthermore, the number of ACS incidences is expected to grow nearly 40% by 2033.² Approximately 70,000 acute myocardial infarctions occur each year in Canada and some 19,000 Canadians die from this condition³.

More About AGGRASTAT®

AGGRASTAT® (tirofiban hydrochloride, or HCl) is an intravenous (IV) non-peptidal antagonist of the glycoprotein (GP) IIb/IIIa receptor, an important platelet surface receptor involved in platelet aggregation. AGGRASTAT, in combination with anticoagulants (e.g. heparin) and other antiplatelet therapies, including acetylsalicylic acid (ASA), is currently approved in Canada for the management of adult patients with non-ST-elevation acute coronary syndrome (NSTEMI-ACS), including patients who may subsequently undergo PCI to decrease the rate of refractory ischemic conditions, new myocardial infarction and death. By blocking fibrinogen from binding to the GP IIb/IIIa receptor, AGGRASTAT prevents the crosslinking of platelets, which is the basis for platelet aggregation. AGGRASTAT is commercialized in 60 countries worldwide, either by Cardiome or via its extensive distributor and partner network. Cardiome acquired Canadian AGGRASTAT® commercialization rights through its acquisition of Correvio LLC in November 2013.

About Cardiome Pharma Corp.

Cardiome Pharma Corp. is a revenue-generating, specialty pharmaceutical company focused on providing innovative, high-quality brands that meet the needs of acute care physicians and patients. With a commercial presence and distribution network covering over 60 countries worldwide, Cardiome develops, acquires and commercializes brands for the in-hospital, acute care market segment. The Company's portfolio of approved and marketed brands includes: Xydalba™ (dalbavancin hydrochloride), for the treatment of acute bacterial skin and skin structure infections (ABSSSI); Zevtera®/Mabelio® (ceftobiprole medocartil sodium), a cephalosporin antibiotic for the treatment of community- and hospital-acquired pneumonia (CAP, HAP), excluding ventilator-associated pneumonia (VAP); Brinavess® (vernakalant IV) for the rapid conversion of recent onset atrial fibrillation to sinus rhythm; Aggrastat® (tirofiban hydrochloride) for the reduction of

thrombotic cardiovascular events in patients with acute coronary syndrome, and Esmocard[®] and Esmocard Lyo[®] (esmolol hydrochloride), a short-acting beta-blocker used to control rapid heart rate in a number of cardiovascular indications. Cardiome's pipeline of product candidates includes Trevynt[®], a drug device combination that is designed to deliver Remodulin[®] (treprostinil) the world's leading treatment for pulmonary arterial hypertension.

Cardiome is traded on the NASDAQ Capital Market (CRME) and the Toronto Stock Exchange (COM). For more information, please visit our web site at www.cardiome.com.
