## LIST OF APPENDICES

APPENDIX 1	Copies of the title documents for all three concessions and Agreement with Minera Gavilan and Almaden Minerals
APPENDIX 2	Copies of the C.R.M. Underground Sample Data Spreadsheets and Assay Certificate for Ing. Artoro Perea samples
APPENDIX 3	Grid Capital Drill Hole Data for the December 2004 Core Drilling Program
APPENDIX 4	Lincoln Gold Sample Data from 2005 Site Visit with Sample Location Map (Figure A), ALS Chemex Assay Certificate
APPENDIX 5	Sample Coordinates and ALS Chemex Assay Certificates from 2006 Lincoln Gold Soil Sample Program
APPENDIX 6	Sample Database from Lincoln Gold 2007 Outcrop sampling and ALS Chemex Assay Certificates
APPENDIX 7	Down Hole Survey Spreadsheet, Geological Cross Sections and Drill Hole Log
APPENDIX 8	Standard and Blank Quality Control Electronic files from ALS Chemex for all Final Assay Reports, Final Certificates are pending

### **3.0 EXECUTIVE SUMMARY**

Richard W. Bybee, Consulting Geologist, has been engaged by Lincoln Gold Corporation, a corporation existing under the laws of Canada, to report on results of the drilling program at the La Bufa Project located near the town of Guadalupe y Calvo in the state of Chihuahua, Mexico. The drilling program, as recommended in a previously issued technical report (Bybee, 2008), was completed in June of 2008. In addition to reporting on the results of the 2008 drilling program at La Bufa, this technical report is also being made in connection with a proposed business combination between Lincoln Gold and LPT Capital Ltd. The author of this report has visited the La Bufa Project on four occasions, including an initial reconnaissance visit July 16<sup>th</sup> through 18<sup>th</sup> of 2005 accompanied by Mr. Jeffery Wilson, Vice President of Exploration for Lincoln Gold. A second visit was made to the property during September 12<sup>th</sup> through the 21<sup>st</sup>, 2006 to conduct a soil survey program, and the third visit was made during the period of June 6<sup>th</sup> through 25<sup>th</sup>, 2007 for the purpose of detailed geologic mapping and outcrop sampling within the southern portion of the La Bufa Concession. The fourth visit to the project, totaling 23 days, was made during the months of February and March of 2008 for the purpose of flagging and preparing the drill sites, preparing the core storage and sampling area, setting up the drill on the first hole location and oversight of general logistics associated with program start up.

The preparation of this report is based on data obtained during these site visits along with reports, title documents, maps and other information contained within the Lincoln Gold files and from government reports.

The La Bufa Project is located in the far southwest corner of the state of Chihuahua, Mexico near the town of Guadalupe y Calvo about 300 kilometers from the city of Chihuahua and 200 kilometers from the town of Hidalgo de Parral. The project is within the Guadalupe y Calvo Mining District and lies within the Sierra Madre Occidental physiographic province. The La Bufa project is comprised of three contiguous mineral concessions totaling approximately 2,291.26 hectares and is held by Lincoln Gold through letters of intent to joint venture and joint venture agreements with Almaden Minerals and their wholly owned Mexican subsidiary Minera Gavilan, S.A. de C.V. The La Bufa Property surrounds mineral concessions of approximately 439.24 hectares held by Gammon Gold where the Rosario Vein was discovered in 1836 and where all of the historic production from the district was derived.

Epithermal-style gold-silver mineralization at Guadalupe y Calvo is hosted in Lower Volcanic Group rocks that consist of bimodal but mainly andesite and diorite calc-alkalic rocks of Eocene and Paleocene age. The Lower Volcanic Group is covered over much of the region by Upper Volcanic Group, which consists mainly of bimodal but mainly rhyolitic calc-alkalic volcanic flows and tuffs of Oligocene age. Pre-Tertiary rocks of Mesozoic marine sediments underlie the volcanic sequences and may also host mineralization. The majority of gold-silver bearing epithermal systems in the Sierra Madre Occidental are hosted in the Lower Volcanic Group rocks so their recognition is

important for exploration. Lower Volcanic Group rocks are structurally complex with a strong northwest trend of faulting and fracturing hosting much of the mineralization.

There are, at present, no definable mineral resources on the Property. However, the author regards the La Bufa Property as highly prospective and worthy of further expenditures for pre-discovery exploration.

Exploration work to date by Lincoln Gold has focused within the southern portion of the La Bufa concession where soil sampling, geologic mapping, outcrop sampling and limited core drilling has been completed. Additional drill targets remain in this southern area of the La Bufa concession and the two Lincoln Gold-controlled concessions to the north remain virtually un-prospected. The exploration targets are low-sulfide epithermal style quartz veins and stockworks hosted in Lower Volcanic Group andesites and diorite intrusives with related propylitic and silicic alteration. To the north, in the La Bufa 1 and La Bufa 2 concessions, Lower Volcanic Group rocks are present and require additional exploration work. The recommended work would involve reconnaissance scale mapping, soils and rock outcrop sampling along with district scale structural interpretations of satellite imagery. Additional work in the southern portion of the La Bufa concession should include detailed evaluation of drill results in relation to surface geology and geochemistry. Results of this work will very likely define additional drill targets that could be recommended for testing.

## 4.0 INTRODUCTION

### 4.1 Terms of Reference

The author of this report, Richard W. Bybee, P.Geo., was retained by Lincoln Gold Corporation (“Lincoln Gold”) as an Independent Qualified Person to conduct a technical evaluation of the La Bufa Gold Property located in Chihuahua State, Mexico. This report was prepared on behalf of Lincoln Gold and LPT Capital Ltd. as an independent technical report in compliance with National Instrument 43-101 for filing with the TSX Venture Exchange.

### 4.2 Purpose

Lincoln Gold is a Canadian registered junior resource company based in Vancouver, British Columbia Canada. LPT Capital, Ltd. is a Canadian registered Capital Pool Company based in Vancouver, British Columbia. This technical report is being prepared in connection with a proposed business combination between the two companies. The purpose of this technical evaluation is to independently verify past work and exploration potential for the property, as well as make recommendations with budget considerations for future exploration work on the Property.

### 4.3 List of Abbreviations

A list of abbreviations for terms and names used in this report is given in Table 1.

**Table 4.1 List of Abbreviations and Names Used in this Report**

Abbreviation/Name	Term
\$	<i>Refers to U.S dollars</i>
C\$	<i>Refers to Canadian dollars</i>
C.R.M.	<i>Consejo de Recursos Minerales</i>
g/T	<i>grams per dry metric tonne</i>
Grid Capital	<i>Grid Capital Corporation, a British Columbia corporation</i>
Ha	<i>Hectares; 1 hectare=10,000m<sup>2</sup></i>
Km	<i>Kilometer(s)</i>
Km <sup>2</sup>	<i>Square kilometer(s)</i>
Lincoln Gold	<i>Lincoln Gold Corporation, Vancouver, BC Canada</i>
Lote	<i>Spanish- mineral lot or concession</i>
LPT Capital, Ltd.	<i>LPT Capital, Ltd., a capital pool company, Vancouver, B.C.</i>
LVG	<i>Refers to Lower Volcanic Group</i>
m	<i>Meter(s)</i>
o.p.t.	<i>Refers to Troy ounces per dry short ton</i>
P.A.H.	<i>Pincock, Allen and Holt geologic consultants, Lakewood Colorado</i>
ppm	<i>Parts per Million</i>
Property	<i>All Lincoln Gold Concession holdings including; La Bufa, La Bufa 1 and La Bufa 2</i>
Surfer	<i>Posting and Contouring Software, Golden, Colorado</i>
UVG	<i>Refers to Upper Volcanic Group</i>

#### **4.4 Sources of Information**

Sources of information used in the preparation of this report consist of:

- Published and un-published technical papers and reports written by governmental agencies or past operators of this and nearby properties available in the Lincoln Gold files,
- Digital data (including geochemical, drill, topographic, air photo and geographic information) provided by local government sources, previous operators and Lincoln Gold,
- Originals (where available) or signed photocopies of analytical certificates pertaining to drill core, rock and soil samples collected on the property by past operators and Lincoln Gold,
- Contracts/agreements and title documents provided by Lincoln Gold pertaining to mineral tenure and surface agreements,
- Regional geology maps published by Consejo Recursos Minerales and,
- Press releases of companies with past or current interests in the area

The key references used in the preparation of this report are:

- Barnard, F., 2004, The Guadalupe Project, Chihuahua, Mexico, Technical Report: prepared for Grid Capital Corporation by Pincock, Allen and Holt (Lakewood Colorado), for filing under National Instrument 43-101

J., 2002, The Guadalupe y Calvo gold-silver project, Chihuahua, Mexico, Technical Report: consulting report prepared for Metales Internacionales S.A. de C.V. and Seven Clans Resources Ltd. by Pincock, Allen and Holt (Lakewood Colorado), for filing under Canada National Instrument 43-101 with respect to what are now the MexGold properties. Available to the public on the SEDAR website.

A complete list of the references used in this report is presented in Section 20.0 (References).

#### **4.5 Site Visit**

The author of this report, Richard W. Bybee, P.Geo., has been on the property for four site visits including an initial reconnaissance visit July 16-18, 2005 accompanied by Mr. Jeffery L. Wilson, Vice President of Exploration for Lincoln Gold. A second visit was

made to the property during September 12-21, 2006 to conduct a soil survey program and a third visit was made during the period of June 6-25, 2007 for the purpose of detailed geologic mapping and surface outcrop sampling on the La Bufa Concession.

The fourth visit to the project, totaling 23 days, was made during the months of February and March of 2008 for the purpose of flagging and preparing the drill sites, preparing the core storage and sampling area, setting up the drill on the first hole location and oversight of general logistics associated with program start up.

## 5.0 RELIANCE ON OTHER EXPERTS

This document is based on information and data collected by the author during the site visits and the public and private information provided by Lincoln Gold and their joint venture partner, Almaden Minerals. The key documents referenced herein included:

Sources of information used in the preparation of this report consist of:

- Published and un-published technical papers and reports written by governmental agencies or past operators of this and nearby properties available in the Lincoln Gold files,
- Digital data (including geochemical, drill, topographic, air photo and geographic information) provided by local government sources, previous operators and Lincoln Gold,
- Originals (where available) or signed photocopies of analytical certificates pertaining to drill core, rock and soil samples collected on the property by past operators and Lincoln Gold,
- Contracts/agreements and title documents provided by Lincoln Gold pertaining to mineral tenure and surface agreements,
- Regional geology maps published by Consejo Recursos Minerales and,
- Press releases of companies with past or current interests in the area

The key references used in the preparation of this report are:

- Barnard, F., 2004, The Guadalupe Project, Chihuahua, Mexico, Technical Report: prepared for Grid Capital Corporation by Pincock, Allen and Holt (Lakewood Colorado), for filing under National Instrument 43-101
- Bybee, R. W., 2007, Technical Report on the La Bufa Property, Guadalupe y Calvo, Chihuahua State, Mexico, prepared for Lincoln Gold Corporation for filing under Nation Instrument 43-101. Available to the public on SEDAR website.
- Carreón, Julio C., 1977, Informe Geologico-Minero del Subproyecto El Chapito, Proyecto Guadalupe y Calvo, Chihuahua. Consejo de Recursos Minerales (in Spanish)
- Wendt, C. J., 2002, The Guadalupe y Calvo gold-silver project, Chihuahua, Mexico, Technical Report: consulting report prepared for Metales Internacionales S.A. de C.V. and Seven Clans Resources Ltd. by Pincock, Allen and Holt (Lakewood Colorado), for filing under Canada National Instrument 43-101 with respect to what are now the MexGold properties. Available to the public on the SEDAR website.

A complete list of the references used in this report is presented in Section 23.0 (References).

### **5.1 Site Visit**

The author of this report, Richard W. Bybee, P.Geo., has been on the property for four site visits including an initial reconnaissance visit July 16-18, 2005 accompanied by Mr. Jeffery L. Wilson, Vice President of Exploration for Lincoln Gold. A second visit was made to the property during September 12-21, 2006 to conduct a soil survey program and a third visit was made during the period of June 6-25, 2007 for the purpose of detailed geologic mapping and surface outcrop sampling on the La Bufa Concession.

The fourth visit to the project, totaling 23 days, was made during the months of February and March of 2008 for the purpose of flagging and preparing the drill sites, preparing the core storage and sampling area, setting up the drill on the first hole location and oversight of general logistics associated with program start up.

### **5.2 Disclaimer**

The author did not undertake a rigorous review of the legal title for the property or the agreements between Lincoln Gold and Almaden Minerals Ltd. Information related to property size, location, underlying ownership and other aspects of mineral tenure was obtained from the concession titles and lease agreement documents supplied by Lincoln Gold Corporation to the author. Almaden Minerals Ltd. And their wholly owned Mexican company, Minera Gavilan, are the underlying owners to the Property and provided the mineral concession documents to Lincoln Gold. The author has not undertaken a rigorous study of the proposed business combination between Lincoln Gold and LPT Capital and is only aware of the general terms of the proposed business combination as stated in the joint press release of the two companies dated October 10, 2008.

**THE AUTHOR TAKES NO RESPONSIBILITY FOR ANY AGREEMENT DISCLOSURES.**

Additionally, the author was not able to confirm the proper position of the El Chapito mineral concession using survey coordinates, as the title documents were not available from the owner. The location of the El Chapito concession was taken from maps provided by Lincoln Gold.

Lincoln Gold provided the author with several maps and reports, which have their original source as private and government. Portions of these maps were modified and digitized into electronic format by the author for the purpose of this report. **THE AUTHOR TAKES NO RESPONSIBILITY FOR THE QUALITY OF DATA PORTRAYED ON THE ORIGINAL MAPS, INCLUDING THE ACCURACY OF GEOLOGIC CONTACTS, FAULTS, MINERALIZED ZONES, DRILL HOLE LOCATIONS, SAMPLE LOCATIONS OR ANALYTICAL DATA**

.

## 6.0 PROPERTY DESCRIPTION AND LOCATION

### 6.1 Location

The La Bufa Project area lies around the town of Guadalupe y Calvo in the state of Chihuahua, Mexico within the rugged Sierra Madre Occidental physiographic province. The project area is approximately 300 kilometers from the state capital of Chihuahua and 200 kilometers from Hidalgo de Parral, the largest nearby city (Figure 6.1.)

The property is accessed by road off Highway 24 from Hidalgo de Parral which in turn can be accessed from Chihuahua City by car or plane.

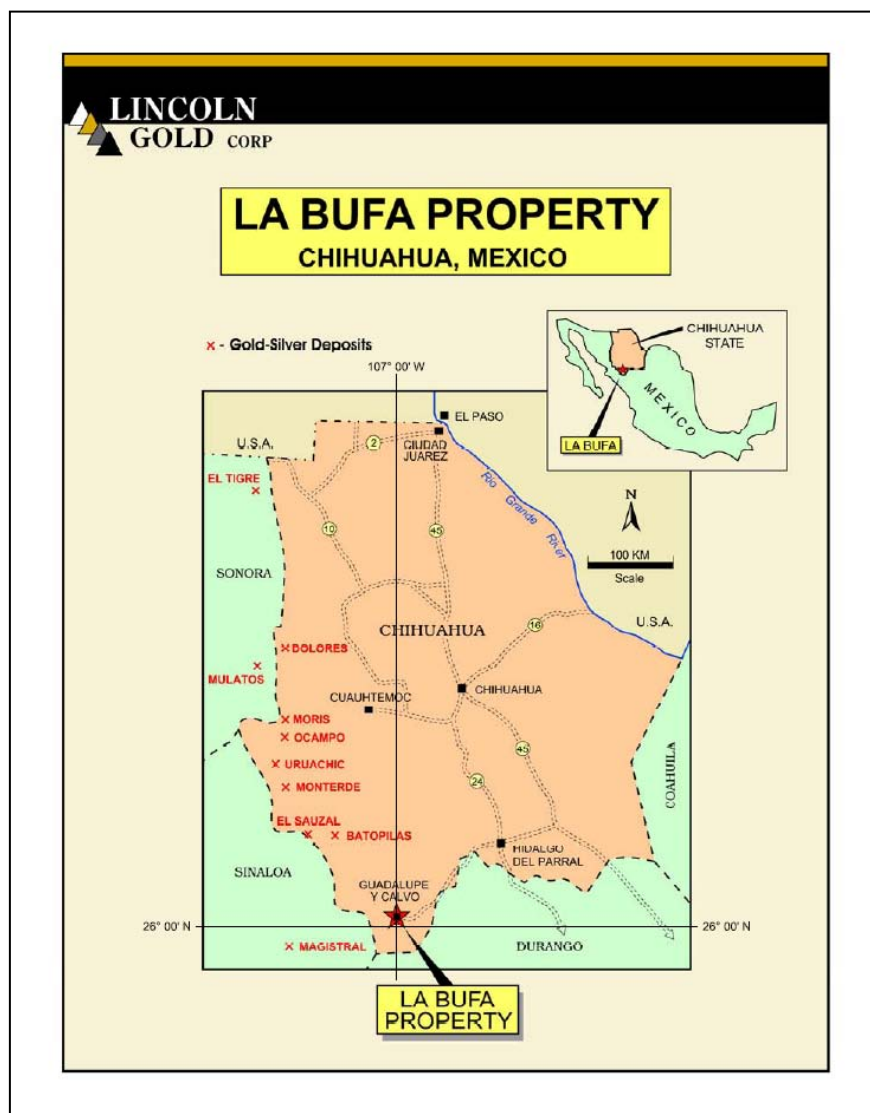

Figure 6.1 General Location of the La Bufa Project

The geographic coordinates are 26°06' north latitude and 106°58' west longitude.

## 6.2 Description

Lincoln Gold's La Bufa Project is comprised of three contiguous mining titles named La Bufa, La Bufa 1 and La Bufa 2 totaling approximately 2,291.26 hectares. This total area excludes an internal block of five contiguous mining titles of approximately 439.24 hectares that covers the historic El Rosario Mine held by Gammon Gold Inc. (formerly Mexgold Resources) and a second internal block of one privately held mining title called El Chapito, totaling 20 hectares (Figure 6.2). The mineral titles for La Bufa, La Bufa 1 and La Bufa 2 contain the reference data that describe the boundaries of the concessions. These boundaries are referenced from a "punto de partido", or departing point, that is located at UTM coordinate 302870.747E and 2888247.901N. The datum used for mineral concessions in Mexico is NAD27 Mexico, Zone 13. The concession boundaries shown in Figure 6.2 were constructed using AutoCAD drawing software and by using the bearing and distance data from the "punto de partido" as listed in the title documents.

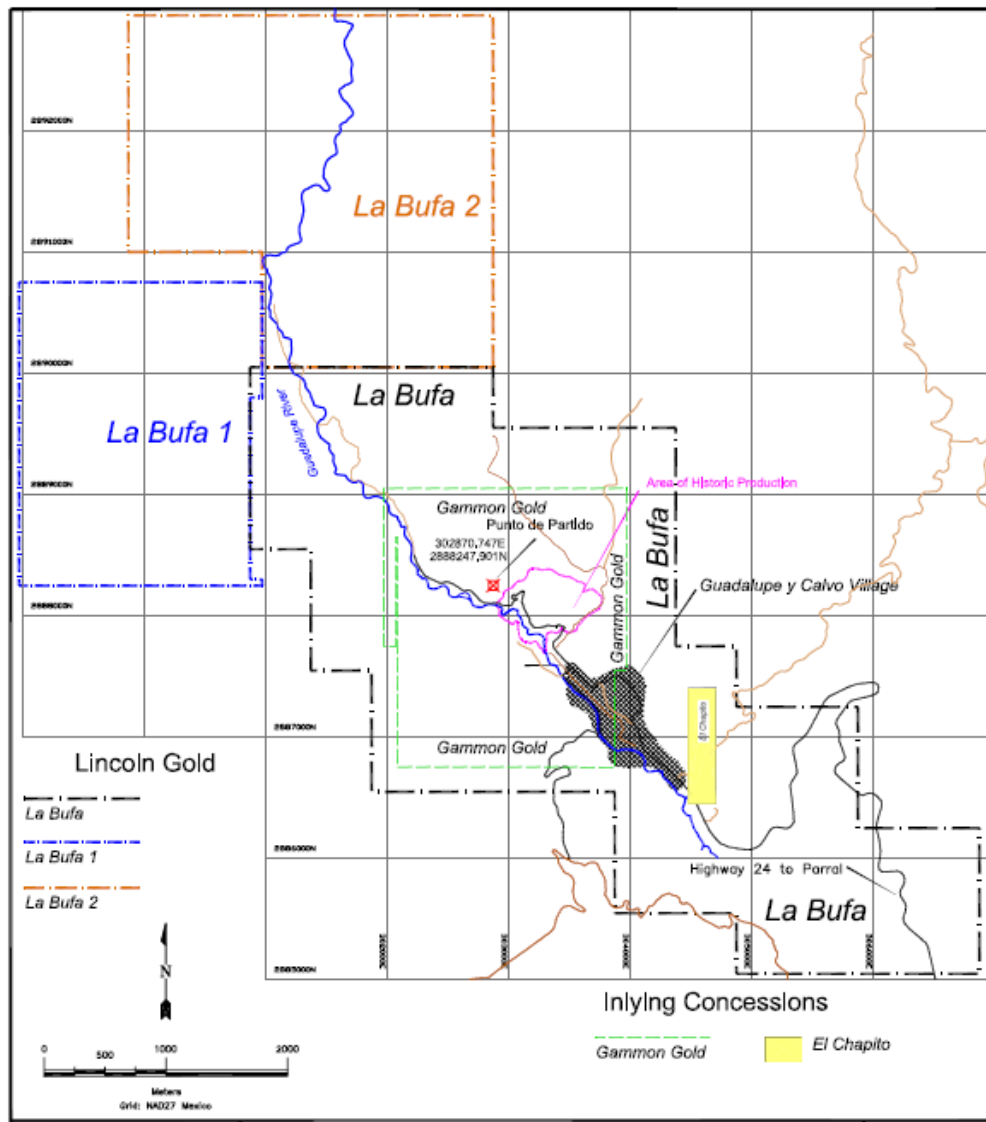

Figure 6.2 Bufo Concession Map

The Property is elongate in a northwest to southeast direction and covers the projected trend of mineralization from the El Rosario Mine. Essentially all of the historic production from the district has come from the Rosario Mine within the concession held by Gammon Gold. Gammon Gold currently reports an inferred Resource at the Rosario Mine within their concession holdings (Gammon Gold News Release of August 9, 2006). The historic production and current gold-silver resource information regarding the Rosario Mine owned by Gammon Gold has been made available to the public through numerous press releases, Mexgold Corporate filings (Annual Information Form, 2003) and from Wendt, 2002 (Technical Report on the Guadalupe y Calvo gold-silver project). The author has not independently verified the historic production or the stated resource information but has relied upon the qualifying statements within these reports. The resources stated by Mexgold in their 2003 Annual Information Form were derived from work done by P.A.H in 2002. Terms and resource definitions used by P.A.H, in their report to Mexgold, are based on standards as defined by NI 43-101 and specified by the Canadian Institute of Mining, Metallurgy and Petroleum Standards on Mineral Resources and Reserves. All of the above referenced information is available on the SEDAR website and is the most recent information reported. Gold mineralization within the Gammon Gold concessions, where the historic Rosario Mine is located, has not been shown by any surface geologic mapping, underground development or drilling to continue onto ground controlled by Lincoln Gold. The presence of mineralization within the Rosario block of LVG is not necessarily indicative that gold-silver mineralization will occur in the La Bufa concession at similar grades or vein widths, but a strong regional northwest structural trend exists in the district that appears to have some control on mineralization within the LVG rocks and mineralization on the La Bufa concession.

The La Bufa Property contains one known mineralized vein structure, named the Santo Niño Vein, that can be traced on the surface for about 850 meters. This mineralized vein structure lies within the La Bufa concession just to the east and southeast of the town of Guadalupe y Calvo and is controlled by westerly and northwesterly-trending faults and fractures in a similar structural setting as the Rosario mineralization.

Mine workings along the Santo Niño vein consist of a 32 meter shaft with three levels of drifting that totaling about 78 meters. These workings are referred to as the Montecristo Shaft. Approximately 300 meters along strike to the east; the vein is developed by workings called the El Chapito Mine. The El Chapito workings total about 550 meters of underground development and consists of an adit, three levels of drifts, raises, winzes and some open stopes at the surface. There may have been minor amounts of ore produced at the El Chapito Mine but the author knows of no production records or dates of when these workings were initially developed. About 250 meters along strike to the east, from the El Chapito Mine there are workings referred to as the Santo Niño Mine that consist of a short 30 meter adit and water-fill shaft at the mouth of the adit. Depth of the shaft is estimated at about 10 meters. There are no large waste dumps or tailings associated with mine workings developed along the Santo Niño vein. Housing, roads and parking lots within town of Guadalupe y Calvo have long since covered waste dumps from the Montecristo Shaft and El Chapito Mine, where most of the historic underground development had been done. The small open stopes at the surface above the El Chapito

mine workings are filled with water and are being used by nearby houses for their water supply.

There are no mineral resources or reserves on the Property.

The town of Guadalupe y Calvo lies at the approximate center of the La Bufa concession along both sides of the Guadalupe River. The river flows northwest through most of the length of the La Bufa concession and northerly through the La Bufa 2 concession.

As of the date of this report, there are no known surrounding concessions external to the Property.

### 6.3 Mineral Tenure

Minera Gavilan, S.A. de C.V., a Mexican corporation with an office at Ricardo Flores Magon 67, Int. 8-N Colonia Centro, Parral, Chihuahua 33800, Mexico holds 100% title to the Property and is a wholly owned subsidiary of Almaden Minerals Ltd. (TSX: AMM), a British Columbia corporation with an office at 1103 West Pender Street, Vancouver, B.C., Canada V6C 2T8 (Table 6.1). Lincoln Gold controls the La Bufa Property through an August 8, 2005 “Letter of Intent to Joint Venture” and an April 12, 2007 Joint Venture Agreement with Minera Gavilan and Almaden Minerals. Copies of the title documents for all three concessions and the joint venture agreement are presented in Appendix 1.

**Table 6.1 Title Information Relevant to Lincoln Gold’s La Bufa Project**

<b>Concession Name</b>	<b>Owner</b>	<b>Type<sup>1</sup></b>	<b>Issued</b>	<b>Area (hectares)</b>	<b>Title Number</b>	<b>Expires<sup>1</sup></b>
<i>La Bufa</i>	<i>Minera Gavilan S.A. de C.V. JV to Lincoln Gold</i>	<i>Exploration</i>	<i>1/31/2003</i>	<i>1040.7594</i>	<i>219036</i>	<i>1/30/2009</i>
<i>La Bufa 1</i>	<i>Minera Gavilan S.A. de C.V. JV to Lincoln Gold</i>	<i>Exploration</i>	<i>8/27/2004</i>	<i>485.0</i>	<i>222724</i>	<i>8/26/2010</i>
<i>La Bufa 2</i>	<i>Minera Gavilan S.A. de C.V. JV to Lincoln Gold</i>	<i>Exploration</i>	<i>10/28/2004</i>	<i>765.5</i>	<i>223165</i>	<i>10/27/2010</i>

<sup>1</sup> Article 15 of the Mexico mining law was amended on April 28, 2005 and converts exploration concessions to Mining Concessions with a 50-year term extendable for an additional 50 years.

Holding costs (Table 6.2) are paid to the government twice annually by Almaden and Lincoln Gold then reimburses Almaden. Tax payments to the government are current to end of 2007.

**Table 6.2 Annual Holding Costs to Mexican Government (paid twice annually)**

<b>Concession Name</b>	<b>Area (hectares)</b>	<b>Title Number</b>	<b>File Number</b>	<b>Tax Rate<sup>1</sup></b>	<b>Costs Pesos</b>	<b>Costs US\$<sup>2</sup></b>
<i>La Bufa</i>	<i>1040.7594</i>	<i>219036</i>	<i>16/31696</i>	<i>\$14.24</i>	<i>\$14,821.00</i>	<i>\$1,360.00</i>
<i>La Bufa 1</i>	<i>485.0</i>	<i>222724</i>	<i>16/32275</i>	<i>\$6.88</i>	<i>\$3,338.00</i>	<i>\$307.00</i>
<i>La Bufa 2</i>	<i>765.5</i>	<i>223165</i>	<i>16/32529</i>	<i>\$6.88</i>	<i>\$5,268.00</i>	<i>\$484.00</i>
<b>Total</b>	<b>2,291.2594</b>				<b>\$23,427.00</b>	<b>\$2,151.00</b>

<sup>1</sup>Tax rate is Peso per Hectare

<sup>2</sup>Costs in US\$ is based on exchange rate of \$10.9 Pesos to US \$1.00 and rounded up to nearest dollar and can vary with exchange rates.

The agreement allows Lincoln Gold to earn a 60% interest in the Property over a period of four years using a combination of stock and work commitments. Table 6.3 shows a summary schedule for these payments. Lincoln may terminate any time after the first \$100,000 is spent.

**Table 6.3 Summary of Earn-In Schedule**

<b>Earn in Schedule</b>	<b>Lincoln Gold Shares</b>	<b>Work (U.S.\$)</b>
<i>Upon Signing Letter of Intent</i>	<i>150,000</i>	<i>NA</i>
<i>By 1<sup>st</sup> Anniversary</i>	<i>200,000</i>	<i>500,000</i>
<i>By 2<sup>nd</sup> Anniversary</i>	<i>200,000</i>	<i>750,000</i>
<i>By 3<sup>rd</sup> Anniversary</i>	<i>1,000,000</i>	<i>1,000,000</i>
<i>By 4<sup>th</sup> Anniversary</i>	<i>Nil</i>	<i>1,250,000</i>
<b>Total for 60% Interest:</b>	<b>1,550,000</b>	<b>3,500,000</b>

To date, Lincoln Gold has spent \$1,491,746.20. This expenditure includes work related to a small, 20-hectare inlier concession, El Chapito, which is completely surrounded by the La Bufa property. Lincoln is continuing negotiations to acquire the El Chapito concession. Financial documents provided to the author by the Lincoln Gold accounting department are summarized below and show the amount credited to date on the La Bufa Property (Table 6.4). Work carried out on the El Chapito concession includes part of the soil sample grid and associated assays costs during 2006, the geologic mapping and associated rock outcrop sampling and assay costs during 2007 and 960 meters of drilling with associated assay costs in 2008.

**Table 6.4 Expenditures Credited to La Bufa Property**

<b>Year</b>	<b>Amount Spent</b>	<b>La Bufa</b>
2005	\$4,736.95	\$4,736.95
2006	\$64,424.90	\$64,424.90
2007	\$53,358.35	\$53,358.35
2008	\$1,369,226.00	\$1,369,226.00
<b>Total</b>	<b>\$1,491,746.20</b>	<b>\$1,491,746.20</b>

#### **6.4 Environmental Liabilities and Permits**

There are no known environmental liabilities associated with the Property.

Permits, consisting of an Environmental Impact Study, were submitted to the Secretary of the Environment and Natural Resources in Chihuahua on November 13, 2007 by Lic. Mauricio Heiras, the environmental consultant for Lincoln Gold. A copy of this 86-page report is available in the Lincoln Gold files in Carson, City, Nevada. The *Informe Preventivo y Aviso de Inicio de Actividades* was submitted in compliance with **NOM 120-SEMARNAT 1997**.

Much of the surface ownership over which drilling and surface disturbance was conducted is on land controlled by the municipality of Guadalupe Y Calvo. Discussions were made with the city officials and letters of permission obtained from them that give Lincoln the right to drill from city owned lands. Where surface ownership is privately held, Lincoln consultants met with several of the landowners and have acquired signed contracts for access rights. Lincoln also contracted with Ing. José Alberto Padilla, a professional land consultant, to conduct negotiations, obtain access rights and generally provide public relations with the local citizens and public officials.

## **7.0 ACCESSIBILITY, PHYSIOGRAPHY, CLIMATE, INFRASTRUCTURE, LOCAL RESOURCES**

### **7.1 Access**

The state of Chihuahua is generally well served by transportation infrastructure including paved Federal Highways, secondary roads, an International Airport at Chihuahua City and a railway system. The town of Guadalupe y Calvo is about 240 kilometers southwest on Highway 24 from Hidalgo del Parral, a mining-based city, with a population of about 100,000. Chihuahua City is about 210 kilometers north of Hidalgo del Parral. Driving time from Chihuahua to Guadalupe y Calvo is about 7 hours, depending on traffic.

Around the town of Guadalupe y Calvo a number of dirt roads, most of which were built for logging, provide access to small farms and villages. New road construction is also underway in and around the town of Guadalupe y Calvo to facilitate growth and new housing construction. Some of these new roads provide access to part of the La Bufa concession.

### **7.2 Topography, Elevation and Vegetation**

Guadalupe y Calvo lies within the very rugged Sierra Madre Occidental province of western Mexico. Steep canyon walls and very high relief typify the region. Elevation in and around the project area range from 2,000m to 2,700m and the relief within the concession area is locally steep but mostly somewhat moderate (Photo 7.1).

The Property is covered by a combination of Chihuahua Pines, junipers, scrub oak, manzanita and other various brushes and grass. Around towns and along canyon bottoms, some areas have been cleared and are under cultivation.

**Photo 7.1 View looking northwest to northeast portion of Guadalupe y Calvo**

### **7.3 Climate**

The climate is temperate with cool winters that occasionally produce snowfall and mild summers. Annual precipitation is about 800 mm with most of it occurring from June through September.

### **7.4 Infrastructure**

In addition to paved highway access, Guadalupe y Calvo has electrical power supply from the national grid system, an airstrip used by the military that can also be used by small private and charter aircraft and basic services and supplies. The population of the municipality (similar to a county in Canada or United States) is about 50,000 and it is about 9,000 Km<sup>2</sup> in area with several small isolated ranches and communities. The town of Guadalupe y Calvo may have about 25,000 people. Supplies, equipment and housing needed to conduct an advanced exploration program would be available locally, and any specialized equipment will be available in Hidalgo del Parral.

### **7.5 Local Resources**

The town of Guadalupe y Calvo has a long history of mining and logging industry and would be capable of supporting any new operation. The national electrical grid services the town and sufficient groundwater could be developed by wells. A local labor force is readily available and any specialized technical or operating personnel could be recruited within the country.

Field observations show that there are possible sites available for mine processing plants, waste dumps and mine tailings. The potential sites for these facilities are near the current exploration targets and some are within the current La Bufa concession boundaries. Surface ownership will be privately held, or controlled and owned the town, and will need to be acquired. Large areas required for heap leach processing are not anticipated, as the current exploration targets are for bonanza type epithermal veins that will be developed by modern underground mining methods.

## **8.0 History**

### **8.1 Discovery and Past Production at the Rosario Mine**

Essentially all of the recorded production has been from the central part of the district on ground controlled by Gammon Gold (Formerly Mexgold Resources). Several companies have explored this formerly productive block of ground during the period 1980 to 2004, mostly by review and compilations of historic data, but with some surface and underground sampling and drilling programs also being conducted.

The Guadalupe y Calvo district was discovered relatively late in Mexico's long mining history. Major silver and gold discoveries were made in Chihuahua and adjacent Durango States in colonial times as early as 1567 and up through the 1650's. It was not until 1836 when a local Tarahumara Indian showed the Rosario vein outcroppings to two prospectors. The "discovery" of very high-grade bonanza gold ore in the Rosario vein soon led to the formation of the mining boomtown of Zorrilla. The population quickly swelled to over 10,000 and the name of the town was changed to Guadalupe y Calvo (Wendt, 2002). By 1844 gold production was large enough that the Mexican government erected a mint at the town. By 1849 the bonanza period was over and the mint closed in 1852. Periods of mining activity by well-organized and well-funded companies were 1865-1871, 1895-1940 and 1978-1983. At other times locals worked the mines on a small scale. Total production for the district from 1835 to 1940 is estimated at 2,000,000 ounces gold and 28,000,000 ounces silver (Wendt, 2002) with grades of 37 g/T gold and 870 g/T silver.

### **8.2 Past Work on La Bufa Property**

#### ***Pre-2003***

In the northwest portion of the Property, which includes the La Bufa 1 and La Bufa 2 concessions, old stone structures can be seen along the Guadalupe River that may be related to some historic prospecting or mining that is reported to exist in the area but no records are available. The author saw no prospects during a short one-afternoon visit made to this area in June 2007. Other than cursory reconnaissance visits by geologist from companies interested in the district, no known modern exploration work has been done in this area. Almaden Minerals Ltd., through their wholly owned Mexican company, Minera Gavilan, S.A. de C.V. acquired the La Bufa 1 concession in August 2004 and the La Bufa 2 Concession in October of 2004.

In the southeast portion of the Property, on the La Bufa concession, a mineralized structure known as the Santo Niño Vein can be traced intermittently on the surface for over 850 meters (Figure 8.1). The vein has approximately 675 meters of underground development including a 32 meter shaft called the Montecristo, and approximately 300 meters along strike to the east from the Montecristo Shaft, a second area of workings called the Chapito Mine is developed by a main Adit Level cross cut (2330m elev.), drifts, raises and winzes. Here the vein was also stopped for about 30 meters along strike

and at least 40 meters up dip above the main adit level. The vein dips steeply south to near vertical and vein widths in the developed areas are generally one to two meters. Approximately 250 meters to the east of the El Chapito Mine there is another adit on the Santo Niño Vein. These workings are referred to as the Santo Niño Mine and consist of a winze of unknown depth (filled with water) at the mouth of the adit and at least 30 meters of drift (Photo 8.1). A small stockpile of ore consisting of quartz vein, pyrite and silicified rock is also present near the mouth of the adit.

**Photo 8.1 Santo Niño Mine Adit, View looking East, Note ore stockpile (yellow color) to left**

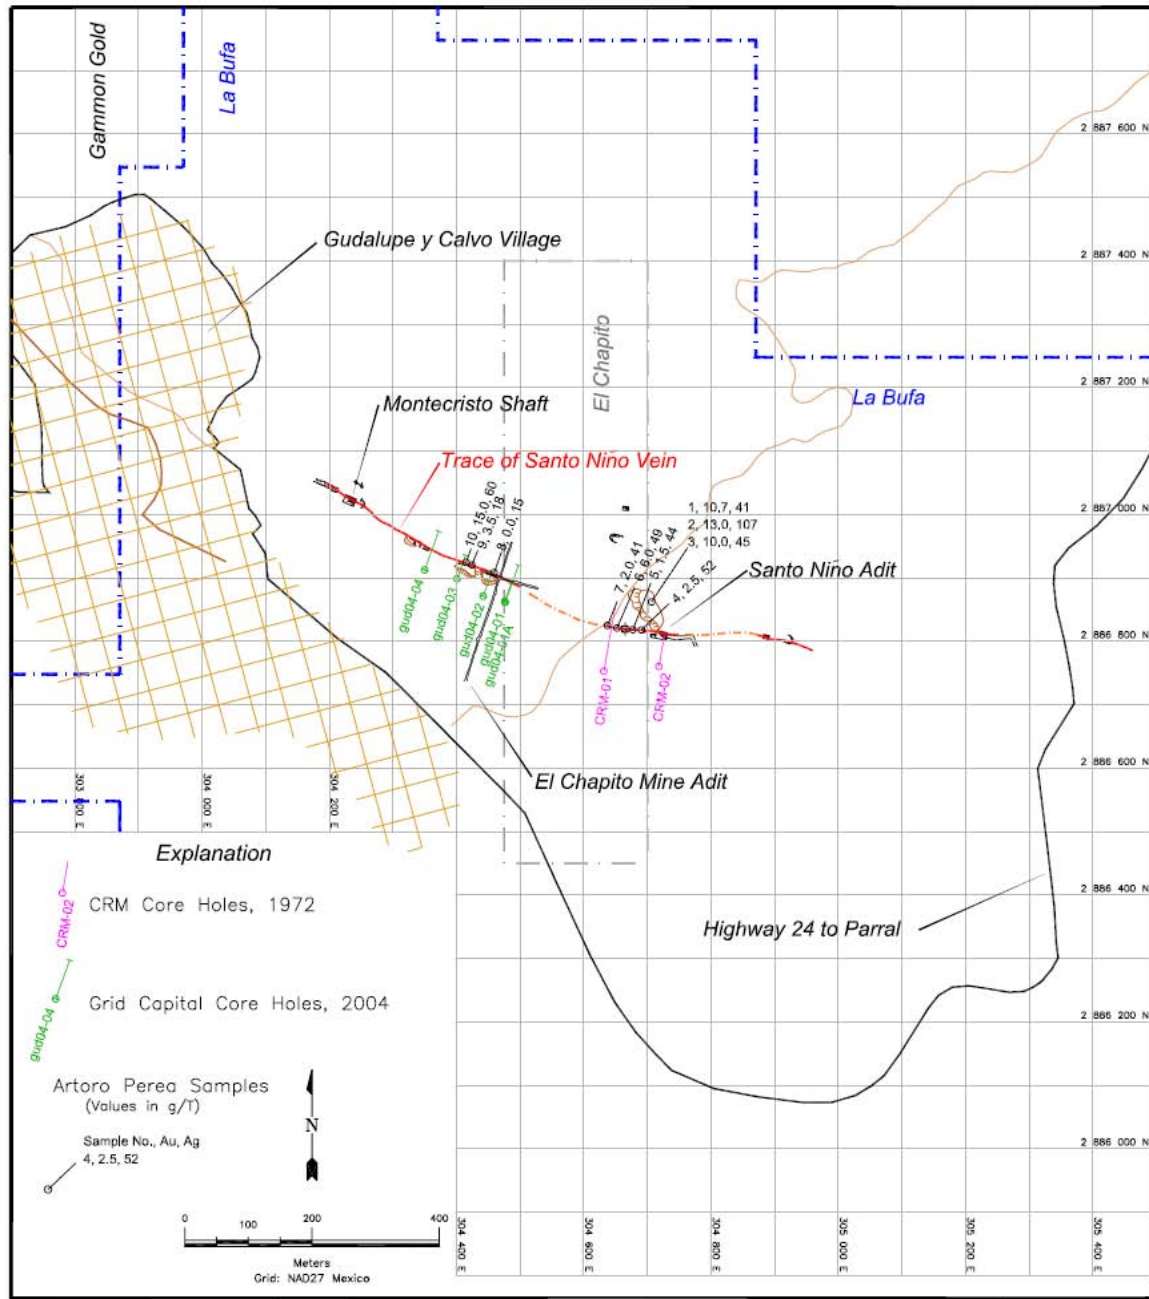

Figure 8.1 Location of Past Work

No production records or dates for this early development work on the Santo Niño Vein are known. Available long section maps (C.R.M., 1977) suggests that less than 15,000 tonnes of vein material of unknown grade would have been extracted from the Chapito Mine prior to 1977. The first available record for the Montecristo-Chapito Mine area is a two-page report (in Spanish) by a Mr. G. Pickard for a company called “Industrial Minera Mexico S.A.” During a two-day visit to the mine on October 28 and 29, 1974 Mr. Pickard produced a report with the following information:

The owner of the mine is Sr. Gilberto Ruiz, he owns three “mineral lotes” named Santo Niño, El Chapito and De Lila; and he is negotiating to acquire the Montecristo mineral lote. He wants to develop the vein in a northwest direction from the Montecristo Shaft and connect to the El Rosario vein, which was the large producer from 1935. Sr. Ruiz has owned these concessions for two years and has rehabilitated the Chapito adit level and over 100 meters of drift, on and above, the adit level (The Adit Level is at the 2330-meter elevation on the Lincoln Gold 2-meter topographic base map and is called the “Zero Level” of the mine). He also opened the raise on the +40 level to the surface. At the time of Mr. Pickard’s visit, the C.R.M. had borrowed a CP-55 core drill from Sr. Ruiz and were in the process of drilling two core holes to test the Santo Niño Vein in the area between the Chapito Mine and the Santo Niño Mine. Sr. Ruiz paid the drillers’ salary and the C.R.M. paid for all other costs. Hole number 1 was abandoned at 145 meters because it reached the capacity of the machine and ended without hitting the vein target. Hole number 2 was in progress at a depth of 40 meters during Mr. Pickard’s visit and they were expecting to cut the vein before 100 meters depth. No geologic logs or assay information are available for this drilling.

The author found the collar location for C.R.M. core hole number 1 during the course of the geologic mapping and sampling in June 2007 and believes these are the two holes that have been incorrectly referred to in several previous Lincoln Gold internal reports as being drilled by ASARCO. The azimuth and dip measurements of the hole found by the author are consistent with collar data found on Mr. Pickard’s map that accompanied his report. Hole locations are shown on the Location of Past Work plan map (Figure 8.1) and the collar coordinates for these holes (Table 8.1) are derived by using the current UTM coordinate system of the project. The dip, azimuth and depth information was found on maps attached to Mr. Pickard’s report.

**Table 8.1 Consejo de Recursos Minerales Santo Niño Core Holes, 1974**

Hole No.	Easting <sup>1</sup>	Northing	Elevation	Azimuth	Dip	T.D, (m)
Hole 1	304631.53	2886752.97	2346	10	-45	145
Hole 2	304718.14	2886760.42	2348	10	-35	unknown

<sup>1</sup> Coordinate System: UTM NAD27 Mexico, Zone 13

Two samples that have also been attributed to these core holes are actually channel samples collected by Sr. Ruiz during the underground visit in the Chapito Mine with Mr. Pickard. They represent channel samples taken on vein structure on the Adit Level of the mine. The values are 1.4 meters of 9.0 g/T Au and 334 g/T Ag with the second sample of 1.0 meter at 6.25 g/T Au and 280 g/T Ag. At the time of Mr. Pickard’s visit the mine was

producing 20 tons per week of unknown grade. Sr. Ruiz was paying \$250 (Unknown if Dollars or Pesos) per ton transportation cost from Guadalupe y Calvo to Parral but it is not known if he was selling floatation concentrates or direct shipping the ore.

In 1977 the C.R.M. returned to Guadalupe y Calvo to further evaluate the Santo Niño vein and conducted a rather extensive sampling program that included 750 meters of new road construction for access to the workings, cleaning and rehabilitating the Montecristo Shaft (20m) and the Chapito Mine main adit level (230m). In addition, over 230 meters of new development was made including drifting on sub-levels, advancing existing raises and winzes; and deepening the Montecristo Shaft an additional 12 meters to a total depth of 32 meters. Apparently by the time this work was started Sr. Ruiz had acquired the Montecristo Mine, as the C.R.M. report lists the concession names and owners on which their work was being done (Table 8.2). The only surviving concession to the present day is El Chapito.

**Table 8.2 Concessions on which C.R.M. work was done, 1977**

<b>Name of Mineral Lote</b>	<b>Title Number</b>	<b>Area (Ha)</b>	<b>Owner</b>
El Chapito	1668	20	Sr. Gilberto Ruiz
Montecristo	1711	43.1767	Sr. Gilberto Ruiz 75%, Luis Aguirre 25%
Dalila	1635	77.37	Sr. Gilberto Ruiz y socio.
Santo Niño	1653	59.9386	Sr. Gilberto Ruiz y socio.

All of this work was done to prepare the mine for a sampling program designed to produce an ore reserve study. A total of 232 channel samples were then collected on the vein structure along backs of drifts, in raises and in winzes. Sampling was done at both the Montecristo Mine and the Chapito Mine. Samples were generally taken along strike or up and down dip in raises and winzes at intervals of 1.5 meters or at times on intervals of 2.0 meters. All of this development work and sampling falls within a vertical range of approximately 60 meters from the 2310-meter elevation to the 2370-meter elevation. Samples were analyzed for gold, silver, lead and zinc at several different laboratories including government and private. Laboratories listed in the Consejo report are 1.) Laboratory Consejo de Recursos Minerales located in Mexico City 2.) Laboratory Moriel in Parral 3.) Laboratory Carrillo located in Santa Barbara, Chihuahua and 4.) Geochemical Laboratory IMMSA in Parral. The Consejo report does not discuss any duplicate, standard or check sampling procedure. A map attached to the Consejo report shows an east-west oriented long section, at a 1:500 scale, of the Montecristo Shaft on the west to the workings of the Chapito Mine on the east. The map identifies all sample locations by number and has tables listing sample lengths and assay values. A copy of these tables is shown in Appendix 2. Ore blocks used to make the resource calculations are also drawn on the long section and there is some limited information on whether the mineralization is oxide or sulfide. The results of the C.R.M. resource calculations at the Chapito Mine and Montecristo Shaft are presented in their report, a copy of which is in the Lincoln Gold files (C.R.M., 1977). This work was done well before the implementation of accepted guidelines for the reporting of mineral reserves and resources definitions as described in Sections 1.3 and 1.4 of the Instrument. Therefore, the methods, terminology and estimates reported by the C.R.M. should be viewed only in their historical context but may be useful in guiding future exploration.

One of the conclusions made by the C.R.M., which has great exploration significance, is that the Santo Niño vein structure needs to be explored down-dip to a depth (unspecified) where the vein is hosted by different units of the LVG. They felt that the current depth of mine was relatively high in the volcanic sequence. The present-day Chapito Concession does not cover the workings of the Chapito Mine, which is on ground controlled by Lincoln Gold.

In 1986 Arturo Perea, a former employee of the Consejo, collected 10 surface samples along the vein structure above the Chapito Mine workings and from the ore stockpile near the Santo Niño Adit. He used a surface plan map from the 1977 Consejo report to plot his sample locations. Samples were analyzed for gold and silver at Impulsora Estatal de la Pequena y Mediana Minería, the Chihuahua State Government Laboratory. A copy of the lab report is in Appendix 2 and sample locations are shown in Figure 8.1. Ing. Arturo Perea is also the current owner of the Chapito claim.

The date of title for the original El Chapito claim is unknown but what is known is that in 1977 the C.R.M. listed the owner as Sr. Gilberto Ruiz with title number 1668 containing 20 hectares. Title research work done in July 2007 by Lic. Mauricio Heiras, a lawyer representing Lincoln Gold, found the current owner to be Arturo Perea with title number 164161 for 20 hectares issued March 5, 1979.

The adit of the Chapito Mine and the Montecristo Shaft have long since been caved and covered by new housing and road developments in the town. The former location of the Chapito adit is now a new city gymnasium and parking lot. A short piece of mine rail is exposed in a cut bank of the parking area but it is unclear if it is “in-place” in the caved mine adit or if it was moved by the earthwork. Two surface cuts (Photo 8.2) are present on the hill above the adit and it appears the vein was stopped to the surface from the workings below. The Montecristo Shaft has been filled and is upslope, adjacent to a new road cut.

**Photo 8.2 Santo Niño Vein at surface cut above Chapito Mine. View is looking west along strike**

2003-2005

Almaden Minerals Ltd. (TSX: AMM), through their wholly owned Mexican company, Minera Gavilan, S.A. de C.V. acquired the La Bufa concession in January of 2003 and in February 2004 the La Bufa concession was optioned to Grid Capital Corporation. The work completed by Grid Capital included the collection and assaying of 154 surface rock chip samples, acquiring a 2-meter resolution color IKONOS satellite image covering the La Bufa concession and limited mapping of geology and vein structures. A portion of the outcrop sampling (13 samples) was done within what is now the La Bufa 1 concession to

the north and several of these samples showed significant gold-silver and copper values but were never followed-up with additional sampling or mapping work.

Pincock, Allen and Holt completed a “Qualifying Report” for Grid Capital in April of 2004 (Barnard, 2004), but the report may have never been filed, as a search of Grid Capital records filed at SEDAR does not show this report.

During November and December of 2004, the drilling of 5 NQ diameter core holes totaling 666.15 meters was completed (Table 8.3). Drilling was focused along a 150 meters strike length portion of the Santo Niño Vein within the area of the El Chapito Mine workings and where the C.R.M. had sampled and calculated the resource blocks.

**Table 8.3 Grid Capital Core Hole Collar File**

Hole No.	Easting <sup>1</sup>	Northing	Elevation (m)	Az	Dip	TD (m)
GUD04-01	304476.00	2886863.00	2385	20	-60	58.75

GUD04-03	304400.89	2886898.73	2380	20	-70	115.00
GUD04-04	304349.85	2886912.59	2374	20	-60	130.00

<sup>1</sup>Coordinata System: UTM NAD27 Mexico, Zone 13

It is not known if Grid Capital was aware of, or had access to, the underground sampling work and report for the El Chapito and Montecristo Mines by C.R.M. Grid Capital’s first core hole (GUD04-01) was abandoned at 58.75 meters when it encountered mine workings. The Location of Past Work map (Figure 8.1) shows the location of the Grid Capital holes and Table 8.4 lists the significant intercepts  $\geq 1.0$  g/T Au and  $\geq 50$  g/T Ag. Grid Capital’s drilling confirmed the presence of the Santo Niño vein between the Montecristo Shaft and the Chapito workings and beyond the limits of the C.R.M. underground sampling. The drilling did not test the concept proposed by the C.R.M. of exploring for the presence of LVG rocks down-dip.

**Table 8.4 Significant Intercepts of  $\geq 1.0$  g/T Au from Grid Capital Core Holes**

Hole No.	From (m)	To (m)	Interval (m)	Au g/T	Ag g/T
GUD04-01	58.35	58.75	0.40	1.55	91.1
GUD04-01a	63.00	63.46	0.46	3.23	195
GUD04-01a	76.49	77.23	0.74	2.29	63.4
GUD04-02				none	none
GUD04-03	64.38	65.20	0.82	17.50	787
GUD04-03	68.91	70.52	1.61	8.70	503
GUD04-03	84.00	84.70	0.70	1.68	>100
GUD04-03	85.32	86.20	0.88	1.56	23.3
GUD04-03	95.40	96.90	1.50	5.96	52.4
GUD04-04	73.18	73.70	0.52	2.87	363
GUD04-04	107.71	108.57	0.86	2.50	109
GUD04-04	121.63	122.45	0.82	1.76	80.8

A detailed report outlining the methods and results of the drilling, core sampling and assaying and geologic logging was completed by Grid Capital in January 2005 (Caelles, 2005). Appendix 3 contains a drill hole collar file, a table of down-hole from-to intercepts for gold and silver values and copies of pages from the Caelles Report showing down-hole multi-element analysis. The core remains on the Property in a rented and locked storage room.

Grid Capital announced in a June 15, 2005 news release that they had terminated the Almaden agreement.

Lincoln Gold acquired the Property (La Bufa, La Bufa 1 and La Bufa 2) under a "Letter of Intent to J.V." with Almaden and Minera Gavilan dated August 8, 2005.

A summary of the exploration history for the Guadalupe y Calvo District is shown in Table 8.5.

**Table 8.5 Summary of Exploration History for Guadalupe y Calvo District**

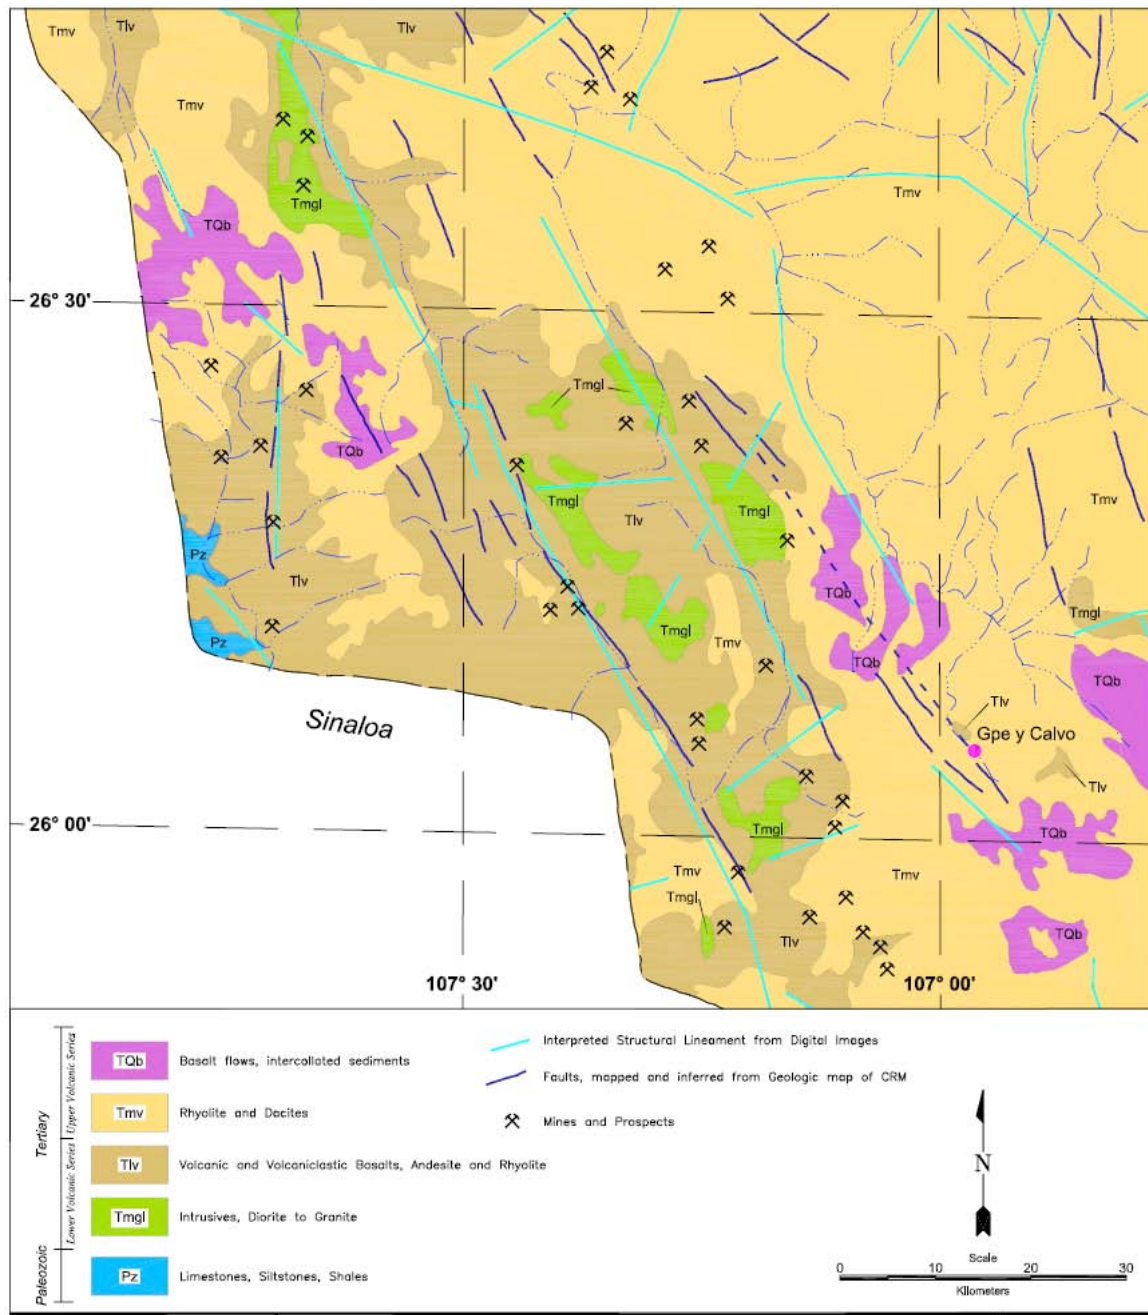

<b><i>Company or Persons</i></b>	<b><i>Date</i></b>	<b><i>Mine or Concession</i></b>	<b><i>Work Completed</i></b>
Unknown Prospectors	1836	Rosario Vein	Discovery of high-grade outcrop
Mexican Government	1844	Rosario Mine	Construct Mint/Operate to 1852
Various	1865-1983	Rosario Mine and vein system	Intermittent periods of production and exploration Total Au production estimated at 2,000,00 oz. to 1940
Unknown	Pre-1972	Santo Niño Vein	UG development at Montecristo, Chapito and Santo Niño Mines. Production tons and grade unknown
Gilberto Ruiz	1972	Chapito Mine	Rehabilitate mine and by 1974 shipping 20 tons/week (unknown grade) to Parral
C.R.M.	1974	Santo Niño Vein	Drilled two core holes in zone between Chapito and Santo Niño workings. Results were "Negative"
C.R.M.	1977	Santo Niño Vein at Montristo Shaft and Chapito Mine	Extensive UG sampling in Chapito and Montecristo. Results used to calculate ore reserve
Almaden Minerals	January 2003	Acquire La Bufa Concession	Option La Bufa to Grid Capital in February 2004
Grid Capital	February 2004	La Bufa	Outcrop sampling (141 samples), acquire satellite imagery, limited geologic mapping. Sampled district to north (13 samples)
Almaden Minerals	August 2004	Acquire La Bufa 1 Concession	To cover area sampled by Grid Capital No known work done
Almaden Minerals	October 2004	Acquire La Bufa 2 Concession	No known work done
Grid Capital	November 2004	La Bufa Concession at Chapito Mine area	Drilled 5 core holes (666.15m) in December 2004. Terminated Option with Almaden Minerals June 2005
Lincoln Gold Corp.	August 2005	La Bufa, La Bufa 1 and La Bufa 2	Acquired Concessions from Almaden Minerals by "Letter of Intent to JV"

## **9.0 GEOLOGICAL SETTING**

### **9.1 Regional Geology**

The Guadalupe y Calvo region of Chihuahua is within the Sierra Madre Occidental, a geologic and geographic province that averages about 200 kilometers wide and is 1,200 kilometers long. It extends from Guadalajara on the south to the southern corners of Arizona and New Mexico to the north (Lewis Geoscience, 1997). The region is characterized by a very thick sequence of Tertiary-aged volcanic and related intrusive rocks that were intruded into, and deposited upon, a deeply eroded surface of Paleozoic and Mesozoic sediments (Figure 9.1). To the west of the district, along the state border with Sinaloa, two blocks of Paleozoic sediments are exposed. The total thickness of volcanic rocks deposited may have been as much as 2,000 meters but is locally variable. The region is typified by deeply incised mountains with very steep canyon walls and has a relief of about 3,000 meters. The Sierra Madre Occidental Province is bordered on the east by the Eastern Mexican Basin and Range and on the west by the Western Mexican Basin and Range. The structural setting of the region is typified by a strong northwest trend of steeply dipping faults.

**Figure 9.1 Regional Geology**

*Geology Compiled and Modified from:*

1.) CRM 1994, *Monograph Series for State of Chihuahua*

2.) Lewis Geoscience Services Inc., 1997, *Structural Interpretations of Digital Topographic Images*

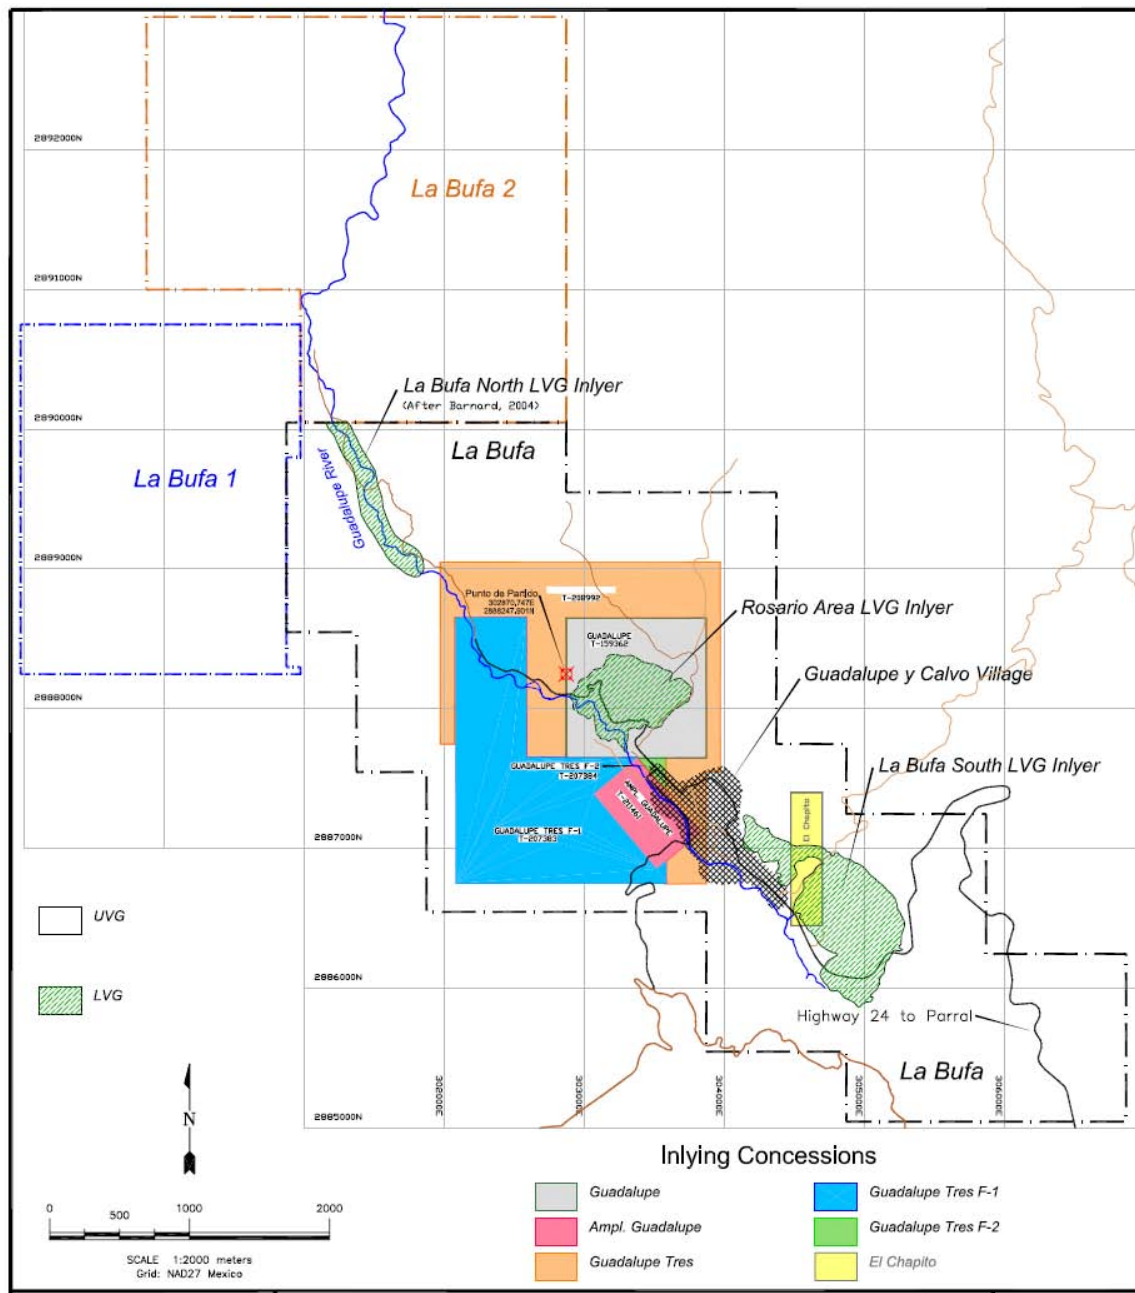

The volcanic stratigraphy in the Sierra Madre Occidental has been divided into two main groups consisting of the “Lower Volcanic Group” (LVG) and the “Upper Volcanic Group” (UVG). The Lower Volcanic series of Eocene to Paleocene age (38 to 65 million years) is dominated by stocks, flows and tuffs of mafic to intermediate composition but more silicic rocks may occur locally. The Upper Volcanic series of Oligocene age (38 to 25 million years) is dominantly extrusive with flows and tuffs of intermediate to silicic composition, although mafic rocks may occur as dikes and small intrusive bodies.

Within the Lower Volcanic series, propylitic alteration is widespread with silicification and argillic alteration seen around mineral systems. Many, if not most, of the hydrothermal alteration and mineral deposits in the Sierra Madre Occidental are hosted in the Lower Volcanic Group and are dated at 40-50 million years.

## **9.2 District Geology**

In the Guadalupe y Calvo District and surrounding area, the Upper Volcanic Group rocks are the most dominant rock type seen in outcrop with three known erosional windows of Lower Series Group rocks being exposed (Figure 9.2). The UVG rocks consist mainly of flows, tuffs of dacite to rhyolite composition and massive felsic ignimbrites. Locally some younger basalt flows overly or may be interbedded, with this sequence. The contact between the UVG and LVG is an erosional unconformity that is rarely exposed. The LVG rocks appear to have been faulted and eroded to form a rugged mountain terrain when the UVG rocks were deposited. The break in deposition between the LVG and UVG is at about 28 million years before present. The LVG rocks in the district consist of andesite dikes and flows and diorite intrusive and are the host rocks for the mineralization at the Rosario Mine and the Santo Niño vein in the southern part of the district.

The structural setting of the district is typified by a strong northwest trend of steeply dipping faults. Steeply dipping faults and fractures are also present along east-west and north-south trends and may be important for hosting some mineralization.

**Figure 9.2 Generalized Geology Guadalupe District**

### **9.3 Property Geology**

Within the La Bufa Property, the Upper Volcanic Group rocks cover most of the area as a very thick pile of gently dipping felsic tuffs and flows. The Lower Volcanic Group rocks are seen locally in canyon bottoms north of the Gammon Gold's Rosario Mine property and as an erosional window slightly larger than a one-half square kilometer in area southeast of the Rosario Mine property in the southeast portion of the La Bufa concession. Recent fieldwork by the author has focused on this southeast area to map contacts and sample vein structures. The northwest part of the La Bufa Property, which includes the extreme northern portion of the La Bufa concession and all of La Bufa 1 and La Bufa 2 concessions, has had very little work completed. The following information covering the northwest portion of the Property is taken from Barnard (2004) and is very interesting in terms of exploration potential.

The northwest portion of the La Bufa Property extends downstream from the Rosario Mine area along the Guadalupe River and adjoining side canyons. Where traversed in the riverbed just northwest of the Guadalupe 3 concession block (Gammon Gold's Rosario Mine) there are exposures of what appears to be Lower Volcanic Group rocks. A massive andesite crops out for about 400 meters and shows propylitic alteration and further downstream, a 60-meter wide dike of andesite cuts bedded volcanoclastic sediments of intermediate composition. The sediments dip about 10 degrees and are not clearly UVG or LVG. Additional exposures of fresh andesite or basalt occur along the north bank of the Guadalupe River near UTM coordinate 301200E: 2890000N. It is apparent that at least some of the rocks in the northwest part of the La Bufa Property are excellent candidates to be within the Lower Volcanic Group and provide possible hosts, feeders or heat source for gold mineralization.

In the southern part of the La Bufa concession a window of LVG rocks approximately 0.7 square kilometers in area is exposed and is surrounded by a very thick pile of UVG tuffs (Figures 9.3 and 9.4). The Upper Volcanic rocks are generally medium to light gray in color and quartz-biotite-rich poorly to non-welded tuffs and tuff breccia. The older rocks, which are mainly tuffs and flows of andesite to dacite composition, are fractured and weakly to moderately altered almost everywhere and form good exposures only locally where silicified along faults or mineralized structures. This block of LVG rocks is typically light orange-brown in color, is quartz eye poor and generally shows an overall weak argillic-silicic alteration. At the southeast end of this block, in a small stream channel on the southeast side of the main highway from Guadalupe y Calvo to Parral, an outcrop of dark green diorite intrusive is exposed for about 75 meters. A one-meter wide basalt dike occurs in the contact between the diorite and altered andesite.

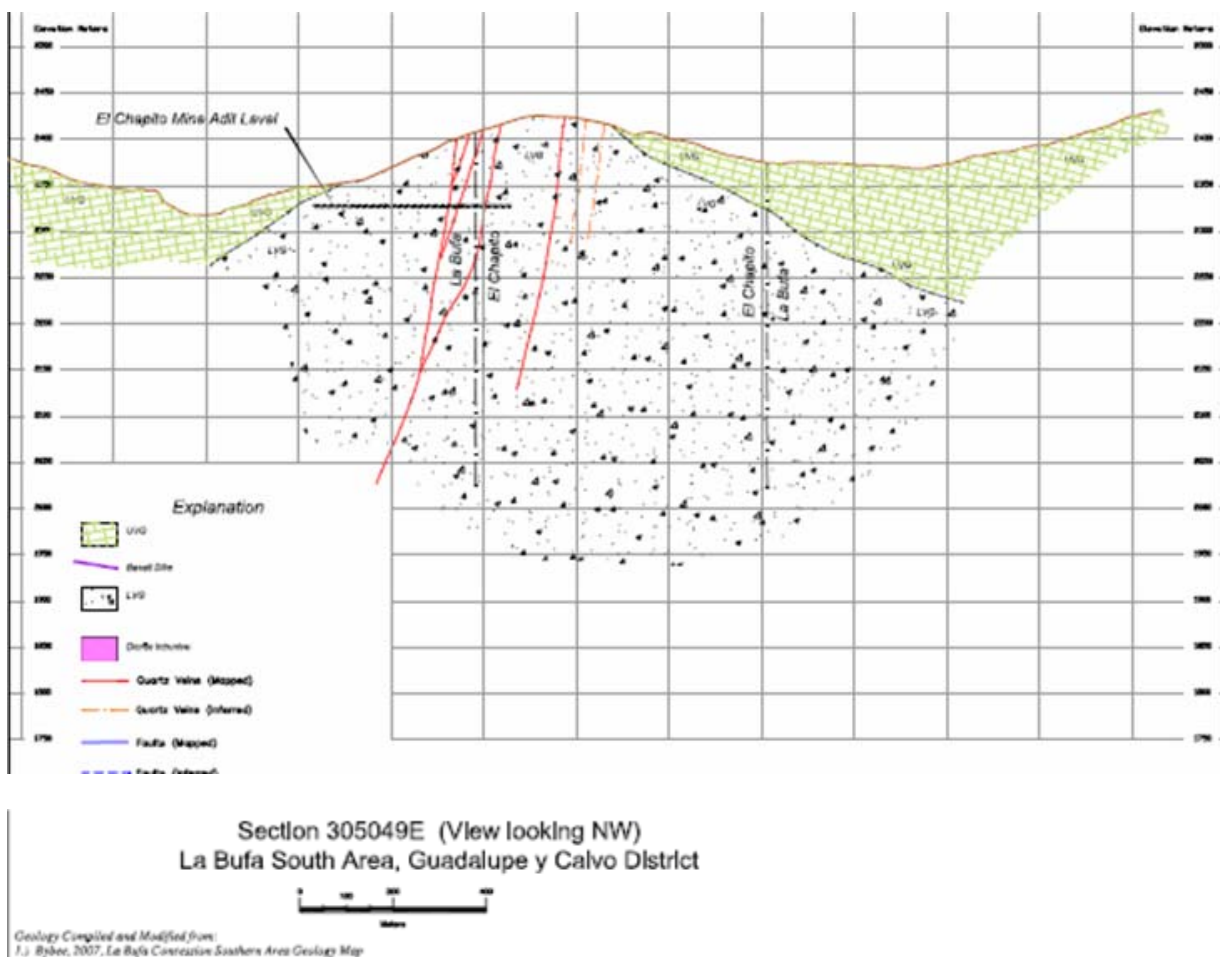

Figure 9.4 Section 305049E (view looking NW)

The contact between the Upper and Lower Series rocks is rarely well exposed, but during the recent mapping it was found in several locations. The contact, as previously described, appears to be a deeply weathered unconformity with a very irregular or mountainous terrain on which the UVG rocks were deposited. At one location (UTM coordinates 304540E; 2886670N) the contact was found to contain a sub-rounded cobble of banded quartz vein material that is inferred to have been eroded from the Lower Volcanic series rocks that host the mineralization in the district (Photo 9.1).

**Photo 9.1 Quartz vein cobble at contact between LVG and UVG rocks. Head of hammer is in weakly argillic and Fe stained andesite tuff (LVG) while gray color rock above handle is quartz-biotite rich crystal tuff (UVG)**

The main structural trend in this southern block of LVG rocks is west-northwest to westerly with steep southerly dips. The Santo Niño Vein is hosted by this fault and fracture set and can be followed along strike in outcrop and silicified sub-crop for about 850 meters. During the recent mapping and sampling work, quartz veining and alteration related to mineralization were found to occur along strike directions of east west and northwest with steep south and southwest dips, while north striking faults and fractures showed steep dip directions to the west and east and also were seen hosting quartz veinlets.

## **10.0 DEPOSIT TYPES**

The ore deposits of Guadalupe y Calvo are classified as a typical epithermal gold-silver, structurally hosted deposits and are similar to numerous other deposits in the Sierra Madre Occidental Province. Mineralization occurs within, and is controlled by fissure-filling veins, stockworks and locally breccia that show the typical epithermal features of open space filling and veins of banded quartz-chalcedony. Wall rock adjacent to the veins is typically silicified but may locally show argillic alteration while propylitic alteration is more widespread throughout the host rock. Data is lacking on details of vein and ore mineralogy but observations of mine dumps and vein outcrop within the historic producing area of the Rosario Mine and the La Bufa Property show the presence of pyrite and locally arsenopyrite with sparse galena, sphalerite and copper minerals. The ore minerals are thought to be electrum and argentite. Based on the vein and ore mineralogy, and host rock alteration, the deposit is classified as a low-sulfidation quartz-adularia type.

Typical of these types of systems, there is a favored structural control for mineralization and at Guadalupe y Calvo the favored trends are northwest to west-northwest.

## 11.0 MINERALIZATION

Gold-silver mineralization in the southern portion of the La Bufa concession occurs within the Santo Niño Vein over a strike length of 850 meters. With some minor deflections in strike direction, the vein and related faults follow a west-northwest trend and dip steeply (50 to 90 degrees) south. In outcrop, the vein is seen as a silicified ledge or resistant zone containing banded quartz veins up to 0.5 meters wide with subsidiary anastomosing veinlets and local quartz breccia. Width of this vein “envelope” is variable from one to 5 meters. Recent mapping and sampling work in this area has identified at least four additional structures that are sub-parallel to the Santo Niño Vein (Figure 9.3). Approximately 100 to 150 meters to the north (on the footwall side of the Santo Niño Vein) is a parallel structure with intermittent exposures of alteration and quartz veining. This structure follows the general trace of the contact between LVG host rock and UVG post-mineral volcanics and projects under post-mineral cover to the east. South of the Santo Niño Vein, in the hanging wall, there is evidence for at least three sub-parallel mineralized structures. Outcrop is sparse in this area but a broad zone of moderate to locally strong silicification, that forms a large resistant hill, suggests this is a silicified cap to mineralization at depth.

Detailed mineralogy has not been completed on vein material from the La Bufa Property to determine ore minerals and gangue assemblage but based on limited studies and metallurgical characteristics of ore at the Rosario Mine, it is believed that native gold, electrum and argentite are the ore minerals. Observations by hand lens of vein material from dumps and outcrops on the Santo Niño and other parallel veins suggests a similar mineralogy to the ores of the Rosario Mine. Vein from outcrops and prospect dumps in La Bufa consist of banded quartz-chalcedony with open space textures, iron oxides of hematite-goethite, pyrite, with lesser arsenopyrite and trace galena, sphalarite and chalcopyrite.

## 12.0 EXPLORATION

### 12.1 Summary of Exploration Work at La Bufa by Lincoln Gold

In July of 2005 a reconnaissance visit was made to the La Bufa Property to review the geology and mineralization in the district and to generally make an assessment of the exploration potential of the Property. During that visit 16 rock chip samples were collected from mineralized outcrops, prospect dumps and underground workings (Table 12.1). Sample location coordinates, descriptions and multi-element analytical results are attached (Appendix 4) along with the ALS Chemex laboratory certificates and sample plan map.

**Table 12.1 Samples Collected July 2005 by Lincoln Gold**

Sample No.	Easting <sup>1</sup>	Northing	Au g/T	Ag g/T	Sample type/length (m)
B-001	305110.0	2886216.0	0.04	0.5	Chip/3.05

B-016	U.G.		1.12	75.3	UG/1.83

<sup>1</sup> Coordinate System: UTM NAD27 Mexico, Zone 13

Also during that visit, discussions were held with city and government officials that were helpful in gaining insights into local regulations and customs for conducting exploration work in and around the town of Guadalupe y Calvo.

Based on the results of that visit, Lincoln Gold acquired the exploration rights to the Property and began an exploration program consisting of a soil sample program that was completed in 2006. By the end of June 2007, aerial photography to generate a topographic map with 2-meter contour intervals and; geologic mapping and outcrop rock chip sampling had been completed.

A core-drilling program totaling 4,811.85 meters was completed during the period of March through June of 2008.

### 12.2 Soil Survey

A soil-sampling program was completed during the period of September 11 to September 26, 2006. The sample points and grid layout was designed to test the projection of known

mineralized structures from the Gammon Gold's Rosario Mine concession to the southeast through a portion of the La Bufa concession. Lincoln Gold personnel had previously identified the area during the reconnaissance visit in July of 2005. The area covered by the survey is approximately 1,700 meters long in a northwesterly direction and 600 meters wide and generally follows the trend of the Santo Niño Vein and other parallel structures (Figure 12.1). A total of 599 samples were ultimately collected and delivered to ALS Chemex laboratories in Chihuahua, Mexico for sample preparation and shipment to ALS Chemex in Vancouver B.C. for analysis. Samples were collected from what is basically the "C" horizon, and may be more correctly referred to as "rock in soil", as there is poor soil development over most of the area.

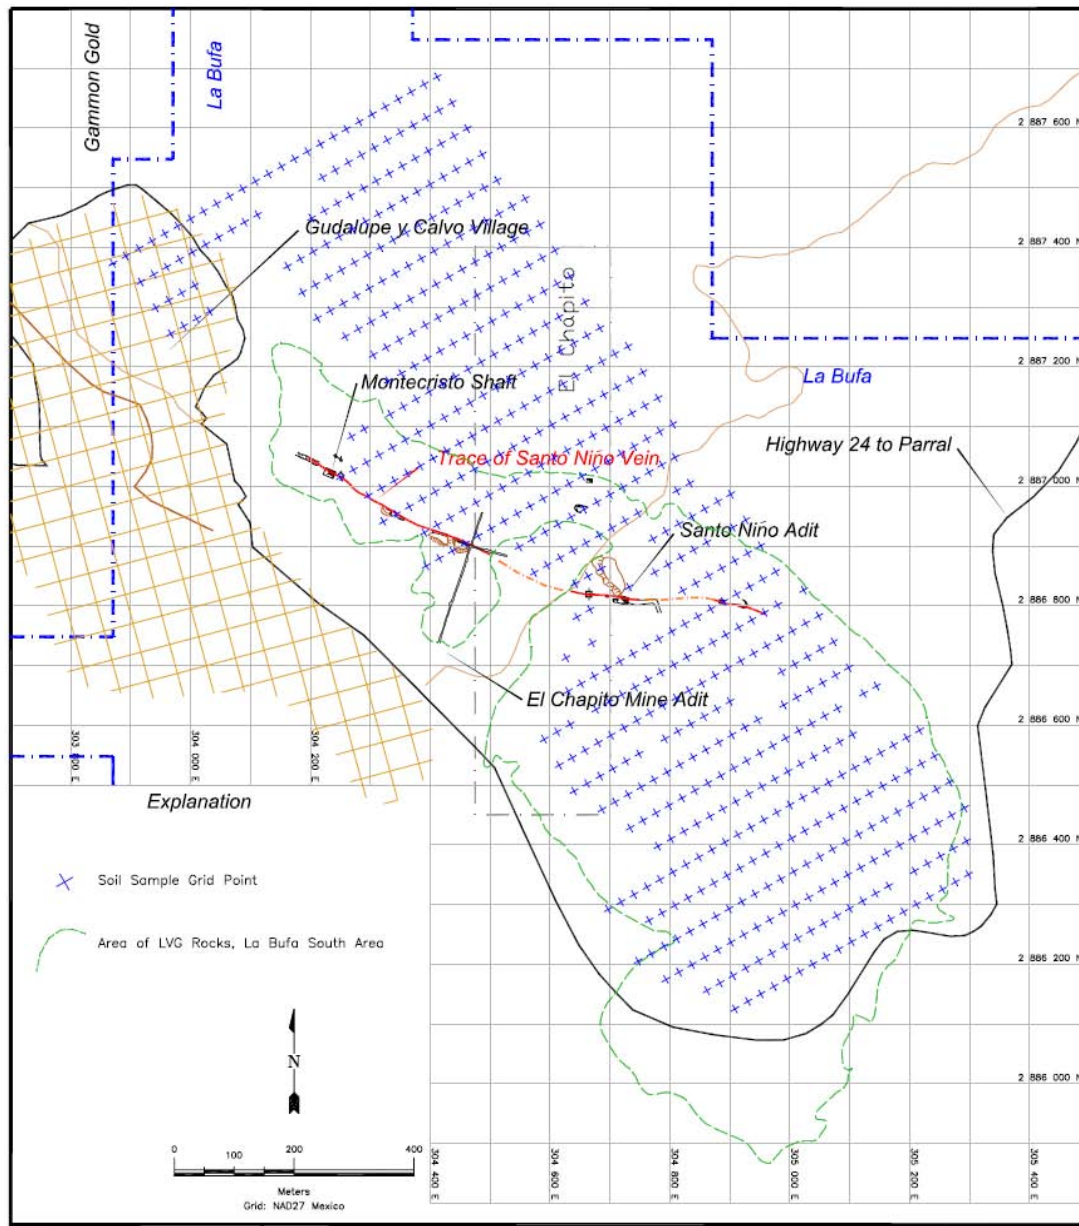

Figure 12.1 Location of Soil Sample Grid

The Mexican-based geologic consulting firm of Cascabel was retained to aid in sample collection and provide transportation and other logistical help with local labor. Cascabel provided a senior geologist, field technician and 4x4 pickup for transportation from Chihuahua to the project site and for daily use to the work areas. Cascabel also arranged for the hiring of local labor to help collect samples and carry samples from the field to the pickup locations at the end of grid lines (Photo 12.1). The Cascabel personnel observed all sample collection and directed the sample collecting methods. They also collected geological information at each sample point that included; sample color, bedrock type and any rock alteration if present. Sample points were marked by orange flagging and an aluminum tag tied to a bush or tree, both of which were labeled with the sample number; and also by a wood stake labeled with the sample number. Sample numbers were based on "Sample Description Cards" that were provided by Cascabel. Sample numbers were written on the outside of each bag and a sample number tag was placed inside each bag. At the completion of the project Cascabel provided Lincoln Gold with all sample cards that contain field notes, sample descriptions and the UTM waypoint coordinate of the sample site.

The author was on-site during the soil survey work and directed the Cascabel geologists as to grid layout, sample collection procedures; and maintained electronic GPS waypoint data and other records.

**Photo 12.1 Cascabel Personnel front left and front right with local helpers.**

Samples were analyzed for gold, silver and 48 trace elements using sensitive ICP methods. A database spreadsheet listing sample number, sample point coordinate and analytical results along with copies of the laboratory certificates are attached (Appendix 5). The spreadsheet database was used to create a gold-in-soil contour map using Surfer data posting and contouring software.

### **12.3 Geologic Mapping and Rock Outcrop Sampling**

Geologic mapping and outcrop sampling was conducted during the period of June 5 through 25, 2007 on the La Bufa concession. Geologic and outcrop sample data was plotted on a topographic base map with 2-meter contour intervals. The UTM grid datum used for the topographic base is NAD27 Mexico, Zone 13, and the topographic base map was produced by Eagle Mapping Ltd. of Port Coquitlam, B.C. from an aerial photo survey flown in October 2006. Geologic mapping was done at a scale of 1:1,000 and is an outcrop style map. A Garmin 76CS GPS (WAAS enabled) was used to locate the outcrop points on the topographic base and when checked at known reference points produced an accuracy of 3-5 meters. The types of information collected at outcrops includes rock type, strike and dip of bedding or foliation, presence of quartz veins with strike and dip, presence of faults with strike and dip. An overlay sheet was used to show rock alteration, plot sample points and add any cultural features including recent or newly constructed houses or roads. Prospects and mine workings not identified on the air photos were also added.

Outcrop samples were also collected during the mapping program. The main focus of the sampling was to locate and sample quartz veins and veinlets throughout the mapping area and to record strike and dip information at all the sample points. A total of 133 samples of fracture-controlled quartz veining and veinlets were collected and analyzed for gold, silver and 40 other trace elements by sensitive ICP methods. A spreadsheet of sample numbers, coordinates, rock descriptions and structural information is attached along with the ALS Chemex laboratory analytical certificates (Appendix 6). The spreadsheet database was used to create a post map of sample points using Surfer data posting and contouring software. The post map shows the structural orientation of the sample and the symbols are color coded for grade range of gold values (Figure 12.2). The Mexican-based geologic consulting firm of Cascabel was retained to aid in sample collection and provide transportation and other logistical help. Cascabel provided a geologist and 4x4 pickup for transportation from Chihuahua to the project site and for daily use to the work areas.

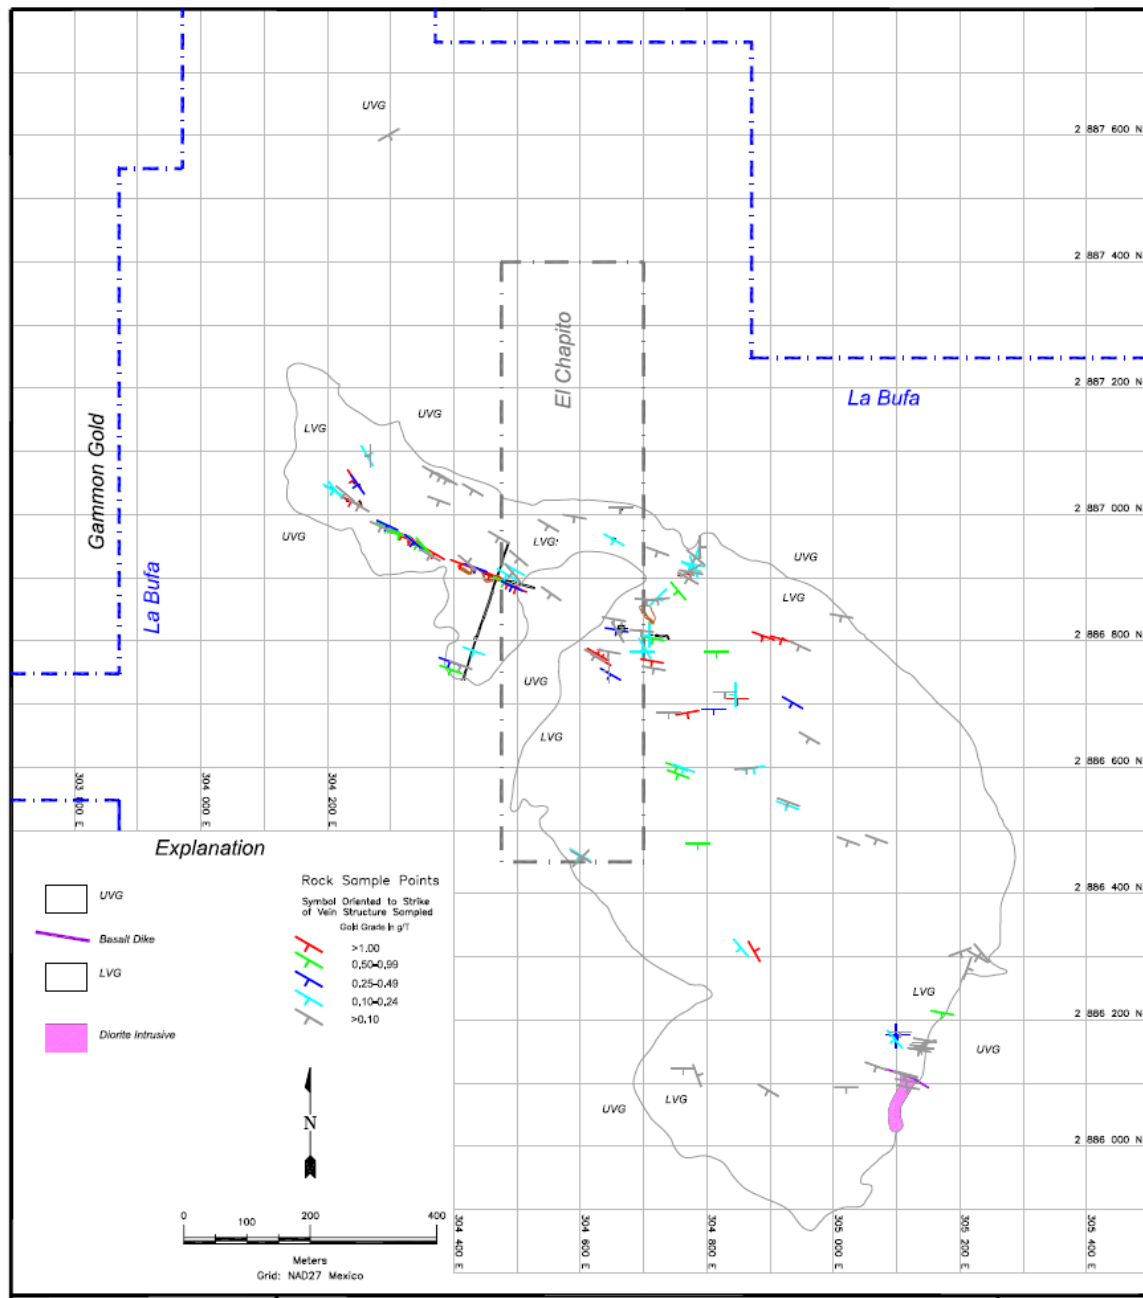

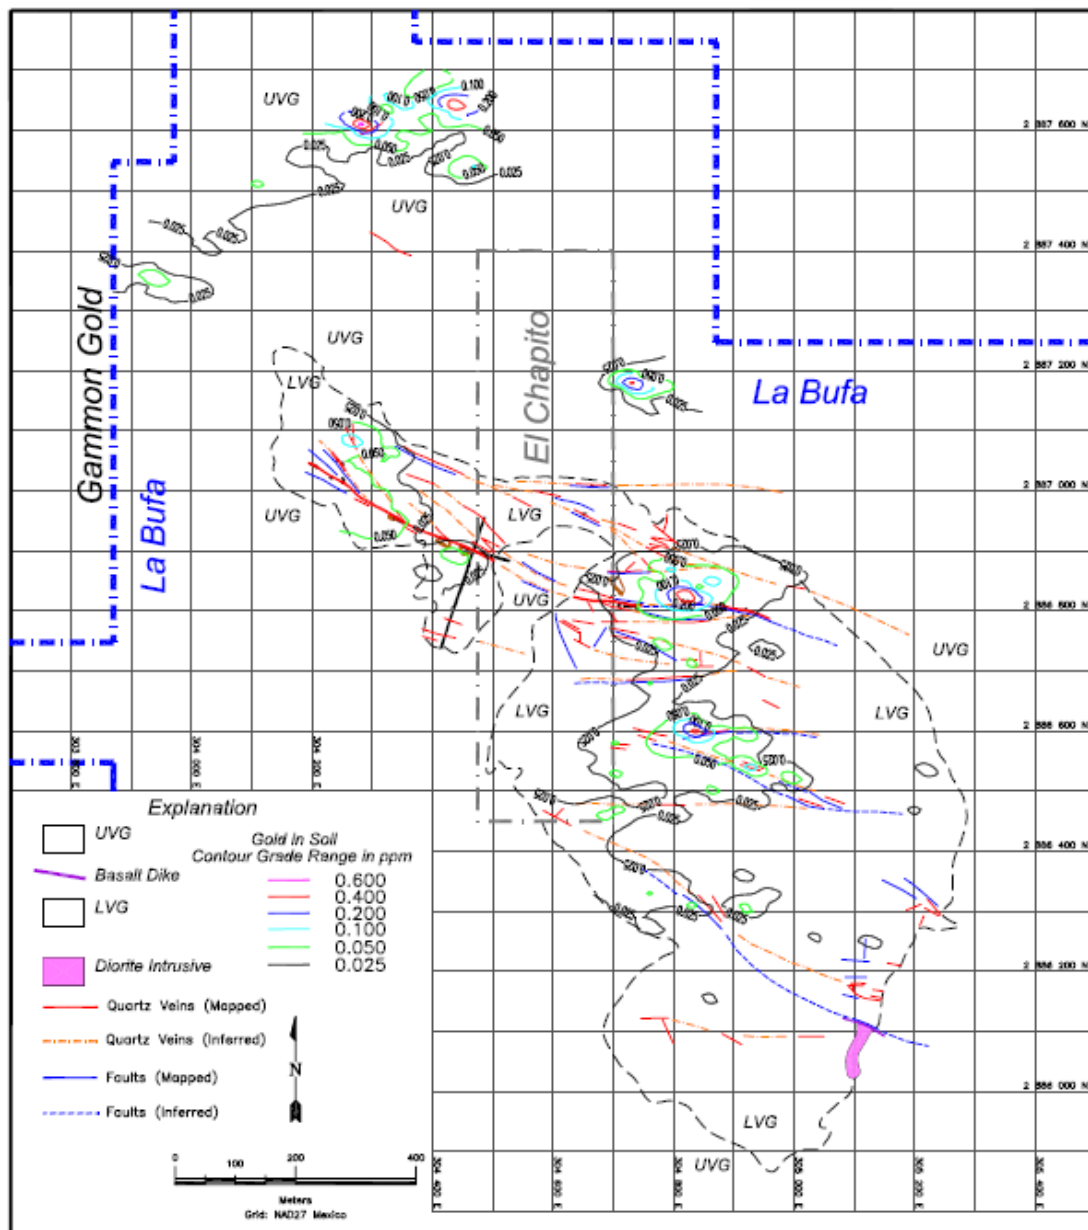

Figure 12.2 Rock Sample Points

## 12.4 Results

Results of the soil survey show the presence of three prominent anomalies related to the Santo Niño structure of greater than 0.100 ppm gold. One anomaly occurs along the trend of the Santo Niño vein structure 100 meters to the east of the Santo Niño Adit in an area that has not been tested by any previous exploration, drilling or underground development work (Figure 12.3). A second well-defined anomaly occurs 200 meters southeast of the Santo Niño Adit in the hanging wall of the Santo Niño Vein where geologic mapping has identified an area of quartz veining and faulting. A third anomaly occurs about 75 meters north of the Montecristo Shaft along a fault and vein structure,

that is parallel to, and in the footwall of the Santo Niño Vein. These anomalies all lie within the LVG rocks and the 0.025 ppm gold contour generally defines the mapped vein and fault structures within this block. Another area where gold values of greater than 0.100 ppm occur is at the northern limit of the sample area. A field check of this area revealed that the anomalies occur in rhyolitic tuffs of UVG rocks in an area of faulting and fracturing where rocks are variably pyritized and silicified. Wide-spaced narrow pyritic quartz veinlets are also present.

Geology Compiled and Modified from:  
1.) Bybee, 2007, La Bufa Concession Southern Area Geology Map

**Figure 12.3 Gold in Soil**

Approximately 400 meters north of the Santo Niño adit, another gold-in-soil anomaly occurs in the rhyolitic tuffs of the UVG rock. The anomaly is represented by only a single sample point in a very thin soil to a sub-crop type material so sample quality is suspect.

Results of the surface geologic mapping and outcrop sampling confirm the presence of gold mineralization hosted by quartz veins and stringer zones throughout the mapped area. The geologic map shown in Figure 9.3 (Section 9.3) is an interpretive geologic map derived from the 1:1,000 scale outcrop mapping completed in June 2007. It shows the veins and faults within a block of LVG andesite tuffs surrounded by the UVG rhyolite tuffs. The contact between the two major units is believed to have a good to very good degree of control on the map. Although only rarely exposed in outcrop the contact can be identified, and followed on the surface, by a change in rock color and mineralogy over distances of just a few meters.

Of the 133 rock chip samples collected, 20 were greater than 1.0 g/T gold with the highest at 280 g/T. Forty-six samples are within the range of 0.50 g/T to 0.99 g/T and only two sample reported less than the detection limit of 0.002 g/T (Figure 12.2). Mineralization with gold values greater than 1.0 g/T was found to occur along the Santo Niño vein and fault complex and in hanging wall and footwall stringers from the Montecrito shaft to the area 200 meters east of the Santo Niño adit. This is the same area that is also defined by the greater than 0.100 ppm gold-in-soils anomalies.

## **12.5 Interpretation**

The surface exploration conducted to date by Lincoln Gold; which includes geologic mapping, soils and outcrop rock sampling, and compilation of available data from previous operators shows that mineralized fault-quartz vein systems are present within a window of LVG rocks in the southern portion of the La Bufa concession. The surface expression of mineralization is typified by outcrops with variably silicified and quartz-veined andesite tuffs of LVG rocks with a geochemical signature including gold and silver in outcrops and in soils along the footwall and hanging wall of the structures. These surface features are present above historic underground development and where limited mining has been done. A significant area of strike length is present where mapped structures show similar features of outcropping veins with related rock and soil geochemistry. It is expected that gold-silver mineralization would be present and continue to some depth in these areas.

One area of particular interest that needs follow-up work is the soil anomaly at the far north end of the soil sample grid area. Here the soil sampling has identified gold mineralization related to variable silicification with trace amounts of disseminated pyrite and quartz stringers in UVG rhyolite. The 0.025 ppm gold contour appears to be opening to the northwest in the direction of the LVG andesites in the Rosario block 700 meters to the northwest. Available satellite imagery shows strong district-scale structures in this area. The soil sampling may be indicating the presence of favorable host rocks and mineralization at depth.

Other areas of the Property, mainly to the north in the La Bufa 1 and La Bufa 2 concessions, remain virtually unexplored or “under-explored” by modern methods.

## **12.6 Data Reliability**

All of the surface exploration work completed by Lincoln Gold prior to the 2008 core drilling has been carried out by the author or by professional geological consultants under the supervision of the author. The author has maintained all of the sample data for soils and rock in electronic files and as hardcopy files. Mapping has been done at scales appropriate to the size of the property allowing for the recording of salient geologic features related to mineralization.

The author was on site for the initiation of the core drilling program to flag and prepare the initial drill sites, organize the core storage and core sampling work area, to install the sampling procedures including the duplicate checks and standards. Management of the day-to-day drill program; including the logging, sampling, all QA/QC procedures and security of samples, was done by consultants retained by Lincoln Gold. The work done by these consultants was completed in a manner as outlined by the author and is considered reliable.

Data related to the core drilling completed by Grid Capital in December 2004, including drilling equipment, logging and sampling methods, and analytical work appears to have been done in a professional manner and is described in the report of drill results by Caelles Geological Consultants, Ltd. (Caelles, 2004).

The sample methods and results reported by C.R.M. for their underground work at the El Chapito Mine (Section 6.2) has been reported only for its historical significance and may be useful as an indication locally for grade and widths of mineralization but data cannot be verified to current reporting standards.

## 13.0 DRILLING

Limited core drilling has previously been completed within the southern La Bufa concession area by C.R.M. in 1974 (see Table 8.1 in Section 8.2) and by Grid Capital in 2004 (see Table 8.3 in Section 8.2). Based on results of exploration conducted during 2006 and 2007, and as recommended in the technical report (Bybee, 2007), a phase I limited core drilling program was completed during the period of March through June of 2008 by Lincoln Gold.

### 13.1 Type of Drilling

The drill contractor for the project was Energold Drilling de Mexico S.A. de C.V. and the type of drill used was a Hydracore Gopher (Photo 13.1). Core sizes drilled were HQ, NTW (5.7cm) and BTW (4.2cm).

Photo 13.1 Hydracore Gopher Drill at Drill Hole LBDDH-001

### 13.2 Area Tested and Extent of Drilling

The drilling was conducted within the southern area of the La Bufa concession to test the Santo Niño and related veins along the northwest structural trend where previous exploration work had been done. A total of 4,811.85 meters were completed in twelve angle drill holes. Approximately 700 meters of strike length over a width of about 300 meters was tested along the mineralized trend with angle holes drilled at  $-45$  and  $-60$

degrees. Average depth of holes is 400 meters and hole spacing was 75 to 150 meters along strike. A drill hole plan map is shown in Figure 13.1. At the completion of the drilling, holes were surveyed by GPS using a Magellan Promark 3 Professional unit (Table 13.1). A drill hole plan map (Figure 13.1) shows the drill hole locations and cross section layout.

Figure 13.1 Lincoln Gold Drill Hole Plan Map

### 13.3 Drilling Procedures

Drilling was done on a 24-hour basis with two shifts per day and working a 7-day week. Drill hole LBDDH-001 was started on March 12, 2008 and the program was completed with drill hole number LBDDH-012 on June 22, 2008. The Hydracore drill is easily portable with a minimum of transport equipment and access road construction required. Generally the unit is moved by hand or by pickup truck and set on a hand constructed drill pad. Down-hole surveys were made on select holes to test for deviation using a Sun Sperry camera at approximately 50-meter intervals. A spreadsheet of the survey results is in Appendix 7.

### 13.4 Summary and Interpretation of Core Drilling Results

The drilling program conducted by Lincoln Gold during the first six months of 2008 in the southern portion of the La Bufa concession has tested approximately 700 meters of strike length along the Santo Niño vein and associated sub-parallel structures. Previous soil sampling surveys, rock outcrop sampling and geologic mapping had identified gold-silver mineralization associated with silicification and quartz veining in this west-northwest trending zone that dips steeply southwest. The drilling program consisted of twelve angle core holes totaling 4,811.85 meters drilled at –45 and –60-degree angles to test across this zone with holes spaced at 50 to 150 meters along strike.

All holes encountered anomalous to significant gold-silver mineralization and locally some very significant base metals of Cu, Pb and Zn. Gold values of greater than 0.50g/T in combination with silver at greater than 5.0g/T were found in 9 holes. Significant base metal values for Cu, Pb and Zn above 1.25% were found in 8 holes. The higher gold values, in the range of 3.00g/T or greater, were found in 4 holes generally at less than 100 meters depth except for one hole (LBDDH-003) where a 1.50 meter interval of 10.70g/T Au was cut at 172 meters. There is a strong suggestion of metal zoning, with silver occurring with gold and being a significant halo around gold mineralization in upper parts of the drill holes and silver continues to be associated with base metals at depth. True widths of mineralization are estimated to be 70% of core sample interval for the –45 degree holes and 50% of core sample interval for the –60 degree holes. The targeted vein structures are near vertical to steeply-dipping southwest.

Mineralization was found along the Santo Niño vein structure and its associated footwall and hanging wall sub-parallel structures as expected. On average, the better grades of gold-silver occur in the northern portion of the area tested, that is, from the area just north of the Monte Cristo shaft (hole 10) to just south of the El Chapito mine adit (hole 6). A table with summary of significant intercepts is presented later in Section 14.0.

Lithologic formations found in the drilling include the Upper Volcanic Group rocks and the Lower Volcanic Group rocks and discussed in **Section 9.3 District Geology**. The diorite intrusive at the southern margin of the property, as mapped in the surface, was found at depth in the core holes.

A set of interpretive geologic sections is attached in Appendix 7.

## **14.0 SAMPLING METHOD AND APPROACH**

This section summarizes the field sampling methods used by Lincoln Gold to acquire soil, rock outcrop and drill core samples for analysis. Individual sample collection procedures for various sample types are summarized in Section 14.1, 14.2 and 14.3. For all samples, Lincoln Gold has employed the following methodology:

1. Samples were collected under the direct supervision of Lincoln Gold geologists or field assistants who were trained in sample collection procedures used by Lincoln Gold,
2. Each sample was collected in new plastic or cloth bag; the sample number was written on the outside of the sample bag and all sample bags were tied closed with wire or plastic ties,
3. Soil and rock samples were removed daily from the field and loaded into rice bags; tied closed with tape then stored in a secure room at the hotel, core samples were removed at the end of each drill shift and taken to the core storage and working area,
4. Soil, rock outcrop and core samples were transported by either the Lincoln Gold geologists or the Cascabel representatives from the project site at Guadalupe y Calvo to ALS Chemex preparation facility in Chihuahua, Mexico. ALS Chemex provides a sample collection service, and at times they collected some of the core samples at the project site by.

### **14.1 Soil Sample Program**

The base map and coordinate system used to design the soil sampling grid is derived from a March 26, 2004 IKONOS satellite 2-meter resolution color image which is geo-referenced in NAD27, zone 13 Datum. A printed hardcopy of the image was available as part of the work done by Grid Capital and was included as part of their data package. The image covers all of the La Bufa concession. A baseline on a 330° azimuth was drawn through the target area and sample fence lines at 50 meter spacing were then placed at 90° to the base line. Sample points were then created at 25 meter spacing along each fence line. This grid layout plan was then put into an AutoCAD drawing and geo-referenced to the base map using the UTM coordinates with the NAD27-Mexico Datum (Figure 12.1). A UTM coordinate for each sample point was then extracted from the AutoCAD drawing and placed into an Excel spreadsheet. A “Grid Point” number and a “Sample Number” identify each point. The sample number refers to the number on the sample bag and is the number reported by the analytical laboratory. The coordinates for each sample point were then uploaded into GPS units and sample points were located and occupied on the ground by using the “Go To” function on the units. Cascabel was also provided a hardcopy printout of the sample point coordinates from the spreadsheet. The GPS units were WAAS capable and accuracy is believed to be within the 2-8 meter range. The two GPS units used by Cascabel were Garman eTrex-Vista and a Garman 60CS. The author used a Garman 76CS GPS unit. At the beginning of the project all GPS units were positioned at a reference point and after a 5-minute period to stabilize, all units were reporting within 5 meters of each other on northing and easting.

Occasionally sample points were repositioned 10 to 15 meters away from the original planned point because of outcrops, roads, houses or some obstruction. A GPS waypoint was created at each actual sample point and this waypoint coordinate is used as the final posting point for data plotting. Before leaving the project, a download of all sample waypoints was made from the 60CS GPS unit but the eTrex-Vista GPS unit did not have cable connection capability at site. Waypoint data from this unit was downloaded by Cascabel at their office in Hermosillo and sent to Lincoln Gold by email. The final Excel spreadsheet of all sampled points is attached (Appendix 5). The sample numbers and grid point numbers were determined before arriving on-site, so there are some proposed points that ultimately could not be sampled because of roads, houses, extensive outcrop or very steep terrain. In these cases an empty sample bag with the sample number and tag was submitted to the lab in order not to create the need for continues revisions in the spreadsheet data which would also create the need to continually upload new waypoint data into the GPS units. The area covered by the survey is approximately 1,700 meters long in a northwesterly direction and 600 meters wide and generally follows the trend of the El Niño Vein and other parallel structures. A total of 599 samples were ultimately collect and delivered to ALS Chemex laboratories in Chihuahua, Mexico for sample preparation and shipment to ALS Chemex in Vancouver B.C. for analysis.

Samples were collected by digging with a rock pick or short steel bar to the zone of weathering rock and then filling a 3.5 inch by 5 inch cloth sample bag with material from the bottom of the hole. Hole depths were quite variable from 10 cm to 30 cm (Photo 14.1).

**Photo 14.1 Collecting Soil Sample**

Samples were collected from what is basically the “C” horizon, and may be more correctly referred to as “rock in soil”, as there is poor soil development over most of the area. The project area is underlain by Tertiary volcanics of rhyolitic to andesitic composition.

#### **14.2 Outcrop Rock Sampling**

Sampling of rock outcrop was done in conjunction with the geologic mapping. The main focus of the sampling was to collect structurally controlled quartz vein, quartz stringers and fracture controlled silica replacement or fillings with oxide clays throughout the mapping area. Quartz stringers and fracture fillings were selectively sampled using rock pick and chisels and the structural orientation of the feature being sampled was documented for each sample. This method is used to determine the relationship, if any, of the geochemistry with the structural setting. A total of 133 samples were collected and analyzed for gold-silver plus 40 other trace elements.

#### **14.3 Core Samples**

When core boxes arrived at the storage and working area, the core was washed, measured to calculate recoveries and photographed. Core photographing is incomplete, with most holes only being photographed in the upper 200 meters. Core is available at the storage facility in Guadalupe y Calvo for photographing. Core was then geologically logged and marked for sampling. Sample intervals were selected based on geologic or alteration contacts such as at quartz veins, quartz stringers or stockwork zones, silicification, presence of pyrite or other sulfides or lithologic changes. A general rule was to keep sample lengths at about 1.5 meters with a about a 3.0 meter maximum. Zones or intervals of wall rock that appeared to be unaltered or with no evidence of quartz veining were not routinely sampled. Drilling conditions were overall good with very few down-hole problems such as loose or broken ground that resulted in poor recovery. Overall recoveries were well above 80% and generally above 90%.

After being marked for sampling the core was cut with diamond saw into equal halves with one half being sent for analysis and the remaining halve being retained in the core box for future reference. The project geologist supervised the core cutting. The cut samples for analysis were placed into clean, new plastic or cloth bags and the sample bags were labeled on the outside with the sample number and a numbered sample card was placed in the bag. The bags were then tied with plastic ties and several bags were loaded into rice bags for transport.

A total of 1,731 samples were submitted to the ALS Chemex sample preparation laboratory in Chihuahua for analysis during the course of the project. This included 1,629 original interval samples, 68 standards and 32 blanks. Duplicate checks, a ¼ cut of the core totaling 5 samples, were made on the first two holes. Additional duplicate checks are pending. The main focus of sampling was zones of geologic interest, primarily the quartz veins, quartz stockwork zones and areas of silicification and sulfides.

#### **14.4 Sample Quality**

Sample quality for the soil samples is considered adequate over most of the area sampled with the main concern being the variability of soil development locally over areas of broad sub-crop or steep slopes. In other areas, because of the proximity to the village of Guadalupe y Calvo, the natural state of the surface has been disturbed by human activity of woodcutting or road and house construction. To the extent possible these areas were avoided or sample locations were repositioned.

The quality of rock chip samples taken from outcrop is considered good with the sampled material and sampling method being consistent throughout.

The quality of the core samples is considered very good and representative of the mineralization being investigated. The method of sample cutting was consistent throughout and core recovery was very good in the mineralized zones, generally greater than 90%. Only hole, LBDDH-10, reported poor recovery of a sampled interval that contained base metal mineralization at a depth of 288.5 meters. One item of consideration is that of sample size because of the smaller diameter of core at depth where holes were reduced from NTW (5.7cm) to BTW (4.2cm). The depth of core diameter reduction is documented in the core logs.

#### **14.5 Summary of Relevant Sample Values**

Of the 133 rock chip samples collected, 20 were greater than 1.0 g/T with the highest at 280 g/T. Forty-six samples are within the range of 0.50 g/T to 0.99 g/T and only two sample reported less than the detection limit of 0.002 g/T (Figure 12.2). Mineralization with gold values greater than 1.0 g/T was found to occur along the Santo Niño vein and fault complex and in hanging wall and footwall stringers from the Montecrito shaft to the area 200 meters east of the Santo Niño adit. This is the same area that is also defined by the greater than 0.100 ppm gold-in-soils anomalies. With the type of rock sampling that was done, the sample width has less relevance than the structural orientation. Sample widths are determined by the width of the fracture filling being sampled. At La Bufa, select samples of quartz veins, quartz veinlets (defined as less than 0.10 meters), and fracture fillings of iron oxide clays with or without silica, were sampled. Sample widths generally were less than 0.50 meters and ranged from 0.05 to 1.50 meters. A data spreadsheet is presented which gives sample number, coordinate, width, structural orientation as well as analytical results (Appendix 6).

For the core drilling, significant intercepts of gold-silver mineralization with additional Cu, Pb and Zn were encountered in all of the drill holes (Table 14.1).

**Table 14.1 Significant Drill Hole Intercepts for La Bufa 2008 Drilling**

Lincoln Gold La Bufa Drilling August 2008

Mineralization within the area tested is hosted in near-vertical to steeply southwest dipping quartz veins and quartz stockwork zones controlled by fractures and faults with similar orientations. The drilling was done using all angle holes with inclinations of –45 and –60 degrees in a northeast direction to test across the structures. The resulting true widths of mineralized intercepts will be less than the intercept core length. For the –45 degree angle holes the true width will be about 70% of the intercept sample length and for the –60 degree angle holes the true widths will be approximately 50% of the sample length.

## 15.0 SAMPLE PREPARATION, ANALYSES AND SECURITY

### 15.1 Sample Preparation and Analysis

Sample preparation procedures and analytical methods used for soil, rock and core samples collected by Lincoln Gold are summarized in Table 15.1. To date, Lincoln Gold has used ALS Chemex Laboratories as the primary lab for all analytical work on the La Bufa project.

**Table 15.1 Sample Preparation and Analytical Methods Used by Lincoln Gold**

Sample Type	Preparation	Analytical Technique
Soil Sample	Samples are dried at 60°C overnight and sieved to 180 microns. Retain both fractions Pulverize fine fraction to 85% passing 75 microns	Au-ICP21: Range: 0.001-10 ppm 30 gram split by fire assay with ICP-AES finish. Over limits are fire assay and gravimetric finish ME-ICP41: Ag plus 34 elements using Aqua Regia digestion
Rock Outcrop	Samples are dried at 90°C overnight. The entire sample crushed to 70% at –6mm  Split 250g and pulverize to 85% passing 75 microns	Au-ICP21: Range: 0.001-10 ppm 30 gram split by fire assay with ICP-AES finish. Over limits are fire assay and gravimetric finish ME-ICP61: Ag plus 32 element package using four acid “near total” digestion
Core Samples	Samples are dried at 90°C overnight. The entire sample crushed to 70% at –2mm  Split 250g and pulverize to 85% passing 75 microns	Au-ICP21: Range: 0.001-10 ppm 30 gram split by fire assay with ICP-AES finish. Over limits are fire assay and gravimetric finish ME-ICP41: Ag plus 34 elements using Aqua Regia digestion

ALS Chemex maintains a sample preparation facility in Chihuahua, Mexico where all of the Lincoln Gold samples have been submitted. The preparation laboratory dries, crushes and pulverizes the samples. A split of the pulp is then forwarded to the ALS Chemex laboratory in Reno, Nevada or Vancouver, B.C., Canada for analysis. ALS Chemex complies with, and is registered under, the international standards of ISO 9001:2000 and ISO 17025:2005. As part of the analytical procedure, ALS Chemex maintains an internal system of duplicates, blanks and standard sample materials that are an integral part of each batch of samples submitted by the client. The Quality Control Manager at the laboratory independently checks the internal quality control samples before assays are released to the client.

## **15.2 Quality Control**

Surface samples collected by Grid Capital were prepared by ALS Chemex in Hermosillo, Sonora with pulps sent to Vancouver, B.C. for analysis. Grid Capital did not document their sample collection methods, security procedures or sample integrity issues.

For the core drilling program completed by Grid Capital, drilling procedures, along with sampling, logging, analytical, and security methods, are documented in a report by Caelles Geologic Consultants, Ltd. (Caelles, 2005) and the work appears to have been done in accordance with current exploration standards.

During the initial reconnaissance visit in July 2005 and during the mapping and sampling work conducted in June 2007, several outcrop locations were found that corresponded to Grid Capital sample locations. Lincoln Gold collected samples at these same outcrops and dumps as a check to compare with the Grid Capital data. A table of assay results for gold and silver at fourteen check sample locations is attached in Appendix 6 and confirms the presence of gold-silver mineralization throughout the prospect area. Although locally quite variable, results are not atypical for samples of silicified andesite host rock containing quartz veinlets in an epithermal environment.

For the core drilling program completed by Lincoln Gold, a Quality Control and Assurance system was instituted. Four certified multi-element (Au, Ag, Cu, Pb, Zn) standards and blanks were purchased from WCM Minerals of Burnaby, B.C., Canada. During core cutting and sample bagging at the core shed, standards and blanks were inserted into the sample stream at a frequency of approximately 5% for standards (1 in 20 samples) and for blanks at about 2.5% (1 in 50 samples). A limited number of duplicate samples (a ¼ cut of core) were also collected. In 10 of the 12 holes drilled, gold values for standards were under-reported by 2.9% and silver values were over-reported by 2.3%. Blank values for gold and silver were within acceptable limits, with gold values of 0.001 to 0.004 ppm and silver at 0.2 to 0.4 ppm. All Lincoln Gold core samples have been analyzed by ALS Chemex, the primary laboratory, using the same analytical method as shown in Table 15.1 above. Additional check assays at a frequency of about 5% (1 in 20) to be completed by a second laboratory is pending. A spreadsheet for checks of standards and blanks is attached in Appendix 8. Electronic versions of all ALS Chemex assay reports for the core hole drilling are attached in Appendix VIII also, the final certificates are pending.

## **15.3 Security**

The 16 samples collected by Lincoln Gold during the first reconnaissance visit to the Property in 2005 were brought in from the field daily and kept in a secure room at the hotel. The author delivered these samples to the ALS-Chemex preparation lab in Chihuahua, Mexico.

Soil samples collected during the September 2006 soil sampling program were brought in daily from the field by Cascabel personnel and placed into “rice bags” which were then tied closed with wire and stored in a secured and locked basement at the hotel. The author and Cascabel personnel transported the samples from the project site at Guadalupe y Calvo to the ALS Chemex sample preparation laboratory in Chihuahua, Mexico.

Rock outcrop samples collected during the June 2007 mapping and sampling program were brought in daily from the field by Cascabel personnel and placed into “rice bags” which were then tied closed with tape and stored in a secured and locked basement at the hotel. The author and Cascabel personnel transported the samples from the project site at Guadalupe y Calvo to the ALS Chemex sample preparation laboratory in Chihuahua, Mexico.

For the core drilling conducted by Lincoln Gold, core boxes were removed from the drill site and delivered to the core shack each day by Lincoln Gold geologist. The core shack is a secure building with a locked iron gate. All activity in the core shack such as washing, photographing, sample cutting and bagging was done in the presence of Lincoln Gold geologists and the working area remained locked at all other times. The bagged core samples were delivered to ALS Chemex in Chihuahua by Lincoln Gold geologist, or in some cases, the samples were picked up at the projects site by ALS Chemex.

At no time has an employee, officer, director or other associate of Lincoln Gold been involved with any aspect of the sample preparation for this project.

In the authors’ opinion, the methods employed for sample collection, preparation, analysis and security are adequate for the current stage of the exploration program.

## 16.0 DATA VERIFICATION

For the soil sample program, the author used the following procedure to check and verify the sample data:

At each sample site a data card with the sample number was filled to include GPS coordinate of the site, sample color, rock type and comments about any alteration. While the sampling program was in progress, the GPS waypoints taken at the actual sample locations were routinely downloaded from the units into an excel spreadsheet and a hardcopy of the waypoint coordinates was printed. At the completion of the program a map of the sample points was then made from this spreadsheet coordinate data by using Surfer posting and contouring software. The sample numbers were posted at each sample point. The spreadsheet data and map of the plotted points were then checked against field notes on the sample cards to look for duplicate sample waypoints, points where samples were not collected and for samples that were collected at points other than the pre-planned grid point. When a sample could not be collected at a planned grid point, an empty sample bag with the pre-determined sample number was submitted to the laboratory. These sample numbers would then appear on the analytical lab report as “no sample” and could be cross checked with original sample cards as a point labeled as “no sample taken”. The spreadsheet data was then corrected as necessary. All original sample description cards, field notes and other pertinent data are maintained in hardcopy files by the author.

Outcrop samples collected during the course of geologic mapping were drawn on overlay sheets to accurately show the location of the sample point relative to the outcrop. Sample descriptions and structural information pertaining to each sample were written in field notebook dedicated to the sampling. At the completion of the fieldwork, the sample points were then digitized off of the original field map sheets using AutoCAD drawing software to create a database of coordinates for each sample number. A spreadsheet was printed from this database and additional information for each sample such as, structural information, rock type and alteration was added to the spreadsheet. A sample location plot map was then made from the database using Surfer contouring and posting software. When posting the sample point to the map a symbol set was used to correctly show the structural orientation of the feature that had been sampled. The computer generated sample plot was then compared to the original field maps to confirm correctness of sample point, sample number and orientation of structural feature that had been sampled. The electronic data spreadsheet was then corrected as necessary to post all samples and structural features as shown on the original field map. All samples (soils and rock outcrop) collected by Lincoln Gold have been plotted from the electronic database and checked on the plotted map sheets with original field map sheets to validate the location and sample number. The electronic sample database was found to correctly represent the location of sample on the original field sheets. All of the original field mapping sheets and field books, with sample descriptions, are maintained by the author in hardcopy files.

For the core drilling program, the author was on site to institute the QA/QC protocol, as describe in Section 15.2, and provided the senior Lincoln Gold geologist (also an independent consultant) with Certified Standard Reference Materials (standards) purchased from the commercial laboratory of WCM Minerals of Burnaby, B.C., Canada. Since the completion of the drilling, the author has compared hand written logs and sample data sheets to the electronic data and is satisfied that the data is in order. Electronic drill logs need to be finalized to include assay results.

## **17.0 ADJOINING PROPERTIES (Adjacent properties)**

As described in Sections 6.2 and 8.1, the La Bufa Property completely surrounds a block of five contiguous mining titles held by Gammon Gold (formerly Mexgold Resources) that total approximately 439.24 hectares. Essentially all of the recorded gold production in the district, which is thought to be about two million ounces, has come from this block of ground. Surface and underground exploration has been conducted here from 1980 through 2004. Mexgold Resources was merged into Gammon Lake Resources (TSX:GAM) in August 2006 (Gammon Lake Resources News Release on August 9, 2006) and in a June 19, 2007 news release Gammon Lake Resources announced a name change to Gammon Gold, Inc. At the time of the August 9, 2006 news release announcing the merger of Mexgold into Gammon Lake Resources, Mexgold was reporting an Inferred Resource of 11,800,000 Tonnes at a grade of 2.84 g/T Au and 120 g/T Ag. This included surface bulk tonnage and underground mineralization from the two main structures in the Rosario Mine, the Rosario Vein and the Nankin Vein.

The historic production and current gold-silver resource information regarding the Rosario Mine owned by Gammon Gold has been made available to the public through numerous press releases, Mexgold Corporate filings (Annual Information Form, 2003) and from Wendt, 2002 (Technical Report on the Guadalupe y Calvo gold-silver project). The author has not independently verified the historic production or the stated resource information but has relied upon the qualifying statements within these reports. The resources stated by Mexgold in their 2003 Annual Information Form were derived from work done by P.A.H in 2002. Terms and resource definitions used by P.A.H, in their report to Mexgold, are based on standards as defined by NI 43-101 and specified by the Canadian Institute of Mining, Metallurgy and Petroleum Standards on Mineral Resources and Reserves. All of the above referenced information is available on the SEDAR website and is the most recent information reported.

The Rosario structure strikes N 40° W and dips 45° west. The Nankin structure trends east west and dips 35° south. These structures and several other historically gold-producing veins within the Rosario window of LVG rocks have not been shown by any surface geologic mapping, underground development or drilling to continue onto ground controlled by Lincoln Gold. The presence of mineralization within the Rosario block of LVG is not necessarily indicative that gold-silver mineralization will occur in the La Bufa concession at similar grades or vein widths but a strong regional northwest structural trend exists in the district that appears to have some control on mineralization within the LVG rocks and mineralization on the La Bufa concession.

## **18.0 MINERAL PROCESSING AND METALLURGICAL TESTING**

The author has not found any reference to metallurgical test work or mineral processing for rock or vein material from the La Bufa Property.

## **19.0 MINERAL RESOURCE AND MINERAL RESERVE ESTIMATES**

At present, the La Bufa Property does not contain any mineralization that could be quantified as a mineral resource. Work on the property is at an early stage and Lincoln Gold is in the process of evaluating drill results from the recently completed first phase drilling in the southern area of the La Bufa concession. On the La Bufa 1 and La Bufa 2 concessions to the north, additional surface reconnaissance including basic mapping and sampling will be required to identify potential drill targets.

## **20.0 OTHER RELEVANT DATA AND INFORMATION**

The author is unaware of any additional information concerning the La Bufa property that is pertinent to this report.

## 21.0 INTERPRETATIONS AND CONCLUSIONS

The La Bufa Property covers the trend, to the northwest and southeast, of known mineralized structures at the historic Rosario Mine. The gold-silver mineralization at the Rosario Mine occurs in Lower Volcanic Group andesite flows and intrusive rocks as epithermal quartz veins. The bonanza grade ores at Rosario occurred between the 2,200 meter and 2,330 meter elevation. These favorable hosts rocks are also present in the southeast portion of the La Bufa Concession as a window of thick andesite tuffs and diorite intrusive. Lower Volcanic Group rocks are also known to be present northwest of the Rosario Mine along the Guadalupe River canyon as dense flows and shallow intrusive bodies.

The objective of Lincoln Gold's exploration work at La Bufa was to identify, and drill test, target areas that could result in the discovery of a new and significant gold-silver resource. To date, this work has included geologic mapping, soil and outcrop sampling, and the compilation of historic data to determine the presence (location and grade) of favorable host rocks and associated quartz veining and alteration with gold-silver mineralization in the southeast portion of the La Bufa Concession. A core drilling program totaling consisting of twelve widely spaced angle holes totaling 4,811.85 meters was completed in June 2008 which tested 700 meters of strike length along the Niño vein structure in a zone approximately 300 meters wide. With the completing of the drilling, the company has met its initially stated goals.

Geologic mapping, rock chip outcrop sampling and soil sampling has identified a main through-going mineralized quartz vein structure in the southeast block of Lower Volcanic Group rocks. This vertical to steeply south-dipping structure is the Santo Niño vein and is a west to northwest-trending structure that can be traced in outcrop, or in sub-crop and float for approximately 850 meters. Gold mineralization at 0.50 g/T or greater, hosted in epithermal-style quartz veins, is present in outcrop samples intermittently along the Santo Niño vein and in numerous other quartz stringer veins in sub-parallel structures in the footwall and hanging wall of the Santo Niño structure. At the current stage of exploration, the density of outcrop sampling along the structural trends is sufficient to determine the surface expression and location of possible ore shoots. The anomalous or elevated gold values from outcrop samples data ( $\geq 0.20\text{g/T Au}$ ) are generally consistent with anomalous zones ( $\geq 0.05\text{g/T Au}$ ) in the soil sample data. All of the Lincoln Gold sampling data is considered reliable and consistent with the presence of mapped vein structures and host rock alteration typically associated with gold mineralization in these types of systems.

The Santo Niño vein was explored historically by a crosscut adit, drifts on three levels and raises at the El Chapito Mine, by limited drifting on three levels at the Montecristo shaft and more recently by the limited core drilling completed by Grid Capital. The historic and current exploration along the Santo Niño structure is from the surface at generally the 2,400 meters elevation down to 2,310 meters elevation, which is the deepest level of the El Chapito mine. Geologic mapping has identified a weakly propylitic diorite

intrusive near the southern limit of the La Bufa Concession. The thick unit of andesite tuffs that host the Santo Niño and other mineralized structures in this southern block overlie this intrusive body, which suggests potential for favorable host rocks to some considerable depth in this area. The deepest levels of exploration (2,310 meter elevation) in the southern block of Lower Volcanic Group rocks in the La Bufa concession is very near the upper elevation limit (2,330 meter elevation) from which gold was produced at the Rosario Mine located on the Gammon Gold concessions. This upper productive level at the Rosario Mine is evidenced by a large open cut and numerous mine workings and stopes exposed at the surface.

The author has visited these workings and can verify their presence but is unable to independently verify the tonnage or grades that may have been produced from them (A more complete description of the Rosario Mine and mineralization is available from (Wendt, 2002). It also should be stated that the vertical zoning of gold mineralization occurring at the Rosario Mine is not necessarily indicative that gold mineralization within the southern portion of the La Bufa concession will be similar, but these relationships are useful as a tool or guide for district scale exploration purposes.

These elevation relationships suggest a potential for gold mineralization well below levels of historic work along the Santo Niño structure and should be considered as a guide to hole depths when planning any recommended drilling program. The surface exploration work completed to date by Lincoln Gold has been successful in achieving the initial goals and objectives for the project by identifying target areas that can be recommended for drill testing.

The results of the core drilling show the presence of gold-silver mineralization at depth, within the area tested, to be associated with quartz veins, quartz stockwork zones and silicification as seen on the surface. Silver and associated base metals of Cu, Pb and Zn are strongly anomalous over true widths of up to 10 meters and form a halo around gold. Gold mineralization is present at 1.0 to 10.0 g/T over true widths of 1.0 to 3.0 meters. Drill holes were too widely spaced to allow for any resource modeling at present. Recommendations will be made that should result in better understanding of the structural controls and the possibility to better target potential ore shoots.

The exploration work carried out by Lincoln Gold and its consultants to date is considered reliable, and in the case of any analytical work, is considered reproducible within industry standards.

At present there are no mineral resources defined on the Property but because of favorable geology and geochemistry the Property is definitely worthy of continued exploration. The La Bufa Property remains highly prospective, as the area tested by detailed surface mapping, sampling and wide-spaced drilling represents only a small portion of the total land package. Favorable host rocks, alteration and vein structures, similar to those in the southern area, are known to occur in the northern concession areas.

## **22.0 RECOMMENDATIONS AND GENERALIZED BUDGET FOR PROPOSED WORK PLAN**

It is recommended that Lincoln Gold acquire the El Chapito concession as soon as possible. Negotiations with the landowner have been ongoing and general terms have been agreed to. This should be finalized as soon as possible. The phase-1 drilling program, as recommended in the previous technical report, has now been completed with encouraging results. The geologic and assay data obtained from the drilling program should be plotted on plan and section maps at an appropriate scale so that details of veins or stockwork zones, alteration features, geochemical zoning and lithologic contacts can be modeled. A series of long-sections parallel to the trend of the Santo Niño vein and associated structures (NW-SE) to show drill hole pierce points would be in order. This work would lead to a better understanding of the deposit and very likely the identification of additional drill targets. In the previously submitted technical report, the success of the recommend drilling project was defined as “the discovery of gold-silver mineralization, along the Santo Niño vein or parallel structures in the footwall and hanging wall, with potentially economic grades and widths that would justify continued expenditures on the Property.” The grades of gold-silver are certainly encouraging and the increased Zn, Pb and Cu values at depth suggest that other types of mineralization may be present in the district. Widths of mineralized zones remain problematic.

Preliminary metallurgical studies should be included as part of the follow-up to the recently completed drilling program and would include bottle roll tests along with thin section and polished section investigations to determine basic mineralogy. Core samples with significant mineralized zones are now available.

In addition, follow-up work by mapping and rock sampling in areas of soil anomalies related to quartz veinlets in altered Upper Volcanic Group rocks at the northern limit of the soil grid is recommended. Work in this area is needed in order to better understand the relation between the mineralization within the Gammon Gold controlled ground (the Rosario Mine) and how or if it continues into the southern La Bufa area. Drill testing in this area would essentially be the drilling of “blind targets” along a structural trend.

The previously recommended reconnaissance work throughout the concessions, including mapping and sampling in the northern concessions of La Bufa 1 and La Bufa 2 remains to be completed. This would consist of a district-wide structural study using satellite imagery, air photos and verification by ground checks that should be part of this program. Results of the district-wide reconnaissance in the northern concession areas will very likely lead to the identification of new geochemically anomalous alteration or mineralization in Lower Volcanic sequence rocks worthy of drill testing.

A Phase-II drilling program could be designed to test new areas and complete any follow-up testing in the southern La Bufa area.

A budget for the recommended work is shown in Table 22.1.

**Table 22.1 Budget for Recommended Exploration at La Bufa**

<b>Activity</b>	<b>Amount/Persons</b>	<b>Time Required</b>	<b>Amount (\$US)</b>
<b>Phase-1: Drilling</b>			
Data compilation and GIS Modeling	In office and at site, 2 geologist travel and field expenses	90 days	65,000
Metallurgical	20 samples	90 days	15,000
<b>Phase-1: Drilling</b>	Total to complete compilation on the Phase-1 Drilling Data		<b>80,000</b>
<b>Phase-1: District</b>			
Reconnaissance	2 geologists, 2 helpers	90	90,000
Analytical	600 samples, prep/shipping/multi-Elem		30,000
Data Workup	1 geologist, 1 GIS	30	25,000
<b>District Total</b>			<b>145,000</b>
<b>Phase-2: Drilling</b>	16,000 meters (40 holes at 400m)		<b>4,000,000</b>
To test new targets in the northern concessions and additional drilling in southern La Bufa	Amount includes all expenses, metallurgical, preliminary resource modeling		
<b>Total Phase- 1 &amp; 2</b>			<b>4,225,000</b>

## **24.0 DATE AND SIGNATURE PAGE**

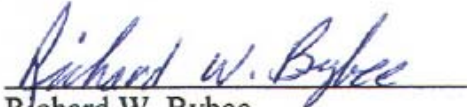

**To Accompany the Report Entitled  
“Technical Report on the La Bufa Property, Guadalupe y Calvo, Chihuahua State,  
Mexico” dated January 5, 2009**

I, Richard W. Bybee do here by certify that:

1. I reside at 4465 Cobra Drive, Sparks, Nevada 89436 USA
2. I graduated from the California State University at Fresno in 1975 with a B.A. Degree in Geology.
3. I am a Registered Professional Geologist No, PG-1505 in good standing with the Wyoming Board of Registration for Professional Geologists, P.O. Box 3008, Laramie, Wyoming, USA 82071-3008.
4. I have worked as a geologist in the mining industry continuously for over 30 years.
5. I am a member of the Geologic Society of Nevada.
6. I have read the definition of “qualified person” as set out in National Instrument 43-101 (NI 43-101) and certify that by reason of my education, affiliation with a recognized professional association (as defined in NI 43-101) and past relevant work experience, I fulfill the requirements to be a “qualified person” for the purposes of NI 43-101.
7. I am responsible for the preparation of the technical report titled “Technical Report on the La Bufa Property, Guadalupe y Calvo, Chihuahua State, Mexico” dated January 5, 2009. I have visited the La Bufa Property for four site visits including July 16-18, 2005 for the initial reconnaissance, September 12-21, 2006 to conduct the soil survey program, June 6-25, 2007 for geologic mapping and rock outcrop sampling and from February 5, 2008 through March 15, 2008 to initiate the drilling program. Prior to this work for Lincoln Gold I have had no involvement with the La Bufa Property.
8. I am independent of the issuer applying all of the tests in section 1.4 of NI 43-101. I do not have, or expect to receive, directly or indirectly, any interest in the properties or securities of Lincoln Gold Corporation, LPT Capital, Ltd. or any affiliated companies.
9. I have read NI 43-101 and Form 43-101F1, and conclude the Technical Report has been prepared in compliance with that instrument and form. The report has been prepared in conformity with generally accepted Canadian mining industry practice.

10. I am not aware of any material fact or material change with respect to the subject matter of the Technical Report that is not reflected in the in the Technical Report, the omission to disclose which makes the Technical Report misleading.
11. I consent to filing of the Technical Report with any stock exchange and other regulatory authority and any publication by them, including electronic publication in the company files on their websites accessible by the public, of the Technical Report.

Signed and dated this 5<sup>th</sup> day of January 2009

  
Richard W. Bybee  
Sparks, Nevada

## **APPENDIX 1**

La Bufa Property Concession Titles and Agreements

**OPTION AGREEMENT BUFA PROPERTY**

THIS AGREEMENT is dated for reference the 12<sup>th</sup> day of April, 2007. 

BETWEEN:

**ALMADEN MINERALS LTD. ("Almaden")**, a body corporate amalgamated under the laws of British Columbia, having an office at 1103 - 750 West Pender Street, Vancouver, B.C. V6C 2T8 and **MINERA GAVILAN, S.A. de C.V. ("Minera")**, a Mexican Incorporated, and wholly owned subsidiary of Almaden with an office at Ricardo Flores Magon 67, Int. 8-N Colonia Centro, Parral, Chihuahua 33800, Mexico

(Collectively, the "Optionors" or "Optionor")

OF THE FIRST PART

AND

**LINCOLN GOLD CORP. ("Lincoln")**, a body incorporated pursuant to the laws of Nevada, and having an office at 325 Tahoe Drive, Carson City Nevada 89703  
(the "Optionee")

OF THE SECOND PART

WHEREAS:

- A. The Optionor is the legal and beneficial owner of the claims, which are located in the State of Chihuahua Mexico and are collectively generally known and described as the "Bufa Property";
- B. The Optionors have agreed to grant an option to the Optionee to acquire up to a 60% interest in the Property in consideration of the Optionee undertaking a work program on the Property aggregating US\$3,500,000 and issuing an aggregate of 1,550,000 shares of the Optionee to Almaden as set forth herein; and
- C. The Optionee is a OTCBB company;

NOW THEREFORE THIS AGREEMENT WITNESSETH that in consideration of the sum of \$10 now paid by the Optionee to the Optionors, the receipt and sufficiency of which is hereby expressly acknowledged, and of the mutual promises, covenants, conditions, representations and warranties herein set out, the parties hereto agree as follows:

**1. INTERPRETATION**

1.1 For the purposes of this Agreement, including the recitals and any schedules hereto, unless there is something in the subject matter or context inconsistent therewith, the following words and expressions shall have the following meanings:

- (a) "Agreement" means this Agreement, as amended from time to time;

- (b) "Area of Interest" means that area within 2 kilometers from the boundary of any of the claims comprising the Property;
- (c) "Environmental Claims" means any and all administrative, regulatory or judicial actions, suits, demands, claims, liens, notices of non-compliance or violation, investigations or proceedings relating in any way to any Environmental Law or any permit issued under any such Environmental Law, including, without limitation:
  - (i) any and all claims by governmental or regulatory authorities for enforcement, clean-up, removal, response, remedial or other actions or damages pursuant to any applicable Environmental Law; and
  - (ii) any and all claims by any third party seeking damages, contribution, indemnification, cost recovery, compensation or injunctive or other relief resulting from hazardous materials, including any release thereof, or arising from alleged injury or threat of injury to human health or safety (arising from environmental matters) or the environment;
- (d) "Environmental Law" means all requirements of the common law, civil code or of environmental, health or safety statutes, regulations, rules, ordinances, policies, orders, approvals, notices, licenses, permits or directives of any federal, state, territorial, provincial or local judicial, regulatory or administrative agency, board or governmental authority including, but not limited to those relating to (i) noise, (ii) pollution or protection of the air, surface water, ground water or land, (iii) solid, gaseous or liquid waste generation, handling, treatment, storage, disposal or transportation, (iv) exposure to hazardous or toxic substances, or (v) the closure, decommissioning, dismantling or abandonment of any facilities, mines or workings and the reclamation or restoration of lands;
- (e) "Effective Date" means the date on which this agreement is executed and delivered ;
- (f) "Mining Work" means every kind of work done on or in respect of the Property or the products there from by or under the direction of or on behalf of or for the benefit of a party and, without limiting the generality of the foregoing, includes assessment work, geophysical, geochemical and geological surveying, studies and mapping, investigating, drilling, designing, examining, equipping, improving, surveying, shaft sinking, raising, crosscutting and drifting, searching for, digging, trucking, sampling, working and procuring minerals, ores, metals and concentrates, surveying and bringing any mineral claims or other interests to lease or patent, reporting and all other work usually considered to be prospecting, exploration, development and mining work;
- (g) "Option" means the sole and exclusive right and option to acquire and undivided 60% legal and beneficial interest in the Property;

- (h) "Property" means those mineral properties more particularly described in Schedule "A" hereto together with any surface rights, mineral rights, personal property and permits associated therewith, and shall include any renewal thereof and any other form of successor or substitute title thereto.

1.2 In this Agreement, all dollar amounts are expressed in lawful currency of the United States of America.

1.3 The titles to the respective Articles hereof shall not be deemed to be a part of this Agreement but shall be regarded as having been used for convenience only.

1.4 Words used herein importing the singular number shall include the plural, and vice-versa, and words importing the masculine gender shall include the feminine and neuter genders, and vice-versa, and words importing persons shall include firms, partnerships and corporations.

## **2. REPRESENTATIONS AND WARRANTIES**

2.1 The Optionee represents and warrants to the Optionors that:

- (a) it has full power and authority to carry on its business and to enter into this Agreement and any agreement or instrument referred to in or contemplated by this Agreement;
- (b) it has full power and has received full corporate authority for the execution, delivery and performance of this Agreement and the execution, delivery and performance of this Agreement and the consummation of the transactions herein contemplated will not conflict with, or accelerate the performance required by or result in any breach of any covenants or agreements contained in or constitute a default under, or result in the creation of any encumbrance, lien or charge under any indenture, agreement or other instrument whatsoever to which they are a party or by which they are bound or to which they may be subject and will not contravene any applicable laws;
- (c) Any matters which arise which impede or delay the progress of work on the property by the Optionee or which may reasonably be anticipated to impede or delay the progress of work on the Property, for whatever cause, must be reported to the Optionor in a timely manner.

2.2 The Optionors represent and warrant to the Optionee that:

- (a) each has full legal capacity and competence to enter into this Agreement and any agreement or instrument referred to in or contemplated by this Agreement and to carry out and perform all of their obligations and duties hereunder;
- (b) it has full power and authority for the execution, delivery and performance of this Agreement and the execution, delivery and performance of this Agreement and the consummation of the transactions herein contemplated will not conflict with, or accelerate the performance required by or result in any breach of any covenants or agreements contained in or constitute a default under, or result in the creation of any

encumbrance, lien or charge under any indenture, agreement or other instrument whatsoever to which they are a party or by which they are bound or to which they may be subject and will not contravene any applicable laws;

- (c) Minera is the sole owner of, and holds good and marketable title to an undivided 100% right, title and interest in and to claims of the Property
- (d) the Property is properly and accurately described in Schedule "A" hereto, and is in good standing under the laws of the jurisdiction in which the Property is located to and the conditions on and relating to the Property respecting all past and current operations thereon are to the best of its knowledge in compliance with all applicable federal and state laws including all Environmental Laws;
- (e) all taxes, assessment, rentals, levies or other payments relating to the Property and required to be made to any federal and state governmental instrumentality have been made;

### 3. OPTION

3.1 The Optionors hereby grant to the Optionee the sole and exclusive right and option to acquire a 60% undivided interest in the Property by the making of expenditures for Mining Work ("Expenditures") and issuing shares of its capital as follows:

- (a) the Optionee must spend US\$500,000 in expenditures (which must include drilling) on the Property by the first anniversary of the Effective date (firm commitment);
- (b) the Optionee makes Expenditures of an additional US\$ 750,000 on the Property by the second anniversary of the Effective date;
- (c) the Optionee makes Expenditures of an additional US\$ 1,000,000 on the Property by the third anniversary of the Effective date;
- (d) the Optionee makes Expenditures an additional US\$ 1,250,000 on the Property by the fourth anniversary of the Effective date;
- (e) the Optionee issues 150,000 common shares of the Optionee to Almaden within 5 business days of the Effective Date(firm commitment);
- (f) the Optionee issues an additional 200,000 shares of the Optionee to Almaden on or before the first anniversary of the Effective date
- (g) the Optionee issues an additional 200,000 shares of the Optionee to Almaden on or before the second anniversary of the Effective date;
- (h) the Optionee issues an additional 1,000,000 shares of the Optionee to Almaden on or before the fourth anniversary of the Effective date;

Any Expenditures in excess of the Expenditures for such period shall be credited towards the Expenditures required for a succeeding period or periods.

The shares to fulfill the Share requirements set forth in section 3.1 (e) to 3.1 (h) shall be issued to Almaden. The Optionee shall use its best endeavours to ensure that all shares are issued without restriction on transfer or if issued with restriction on transfer that such restrictions are removed as soon as possible.

Almaden agrees that, in order to enable the Optionee to comply with applicable United States securities laws, each issuance of Shares to Almaden will be conditional upon execution by Almaden in favour of the Optionee of an Investment Agreement in the form attached hereto as Schedule C in respect of the issuance of Shares.

#### **4. OPTION EXERCISE**

4.1 Upon the fulfillment of the Expenditure requirements and the share requirements as set forth in section 3.1 the Optionee shall be deemed to have earned an undivided 60% interest in the Property (the "Option Exercise"), subject always to compliance with the provisions of Section 6.3 (h).

#### **5. OPTIONEE'S RIGHTS**

5.1 Except as otherwise provided in this Agreement, until the Option is exercised or terminated in accordance with the terms of this Agreement, the Optionee, its servants and agents shall have the sole and exclusive right to:

- (a) enter in, under or upon the Property and conduct Mining Work;
- (b) exclusive and quiet possession of the Property;
- (c) bring upon the Property and to erect thereon such mining facilities as it may consider advisable; and
- (d) remove from the Property and dispose of for its own account ore or mineral products for the purpose of bulk sampling, pilot plant or test operations.

#### **6. POWERS, DUTIES AND OBLIGATIONS OF OPTIONEE**

6.1 Until the Option is exercised or terminated in accordance with the terms of the Agreement, the Optionee shall have full right, power and authority to do everything necessary or desirable to carry out an exploration program on the Property and to determine the manner of exploration and development of the Property and, without limiting the generality of the foregoing, the right, power and authority to:

- (a) regulate access to the Property, subject only to the right of the Optionors and its representatives to have access to the Property at all reasonable times for the purpose of inspecting work being done thereon but at their own risk and expense;

- (b) employ and engage such employees, agents and independent contractors as it may consider necessary or advisable to carry out its duties and obligations hereunder and in this connection to delegate any of its powers and rights to perform its duties and obligations hereunder; and
- (c) execute all documents, deeds and instruments, do or cause to be done all such acts and things and give all such assurances as may be necessary to maintain good and valid title to the Property and each party hereby irrevocably constitutes the Optionee its true and lawful attorney to give effect to the foregoing and hereby agrees to indemnify and save the Optionee harmless from any and all costs, loss or damage sustained or incurred without gross negligence or bad faith by the Optionee directly or indirectly as a result of its exercise of its powers pursuant to this Subsection 6.1(c).

6.2 In the event of any subdivision, consolidation or other change in the share capital of the Optionee prior to the exercise in full of the Option, the number of shares to be delivered or issued to the Optionor thereafter in connection with the exercise of the Option shall be adjusted in accordance with such subdivision, consolidation or other change in the share capital of the Optionee. In the event the Optionee undertakes an amalgamation, merger, reorganization or other arrangement prior to the exercise in full of the Option, the number of shares to be delivered or issued to the Optionor thereafter shall be adjusted in accordance with such amalgamation, merger, reorganization or other arrangement.

6.3 Until the Option is exercised or terminated in accordance with the terms of this Agreement, the Optionee shall have the duties and obligations to:

- (a) Keep the Property free and clear of all liens and encumbrances arising from its operations hereunder (except liens contested in good faith by the Optionee)
- (b) Keep the Property in good standing by the doing and filing, or payment in lieu thereof, of all necessary assessment work and payment of all taxes required to be paid and by the doing of all other acts and things and the making all other payments required to be made which may be necessary in that regard, and shall provide to the Optionors proof of such filing and payment or payment in lieu not less than 30 days before the due date of such filing or payment ;
- (c) Permit the Optionors and representatives, duly authorized in writing by them or either of them, access to all records prepared by the Optionee in connection with Mining Work. The Optionee shall prepare and deliver to the Optionor at reasonable intervals, but in any event not less frequently than once each calendar quarter, reports on all Mining Work conducted by the Optionee. A formal written report prepared by a qualified person under the meaning of National Instrument 43-101 is required by the Optionor no later than May 15th of each year, to detail and describe the work performed during the preceding 12 months; If the optionor terminates the agreement before this date, the report is required within 14 days of the notice of termination.
- (d) Conduct all work on or with respect to the Property in a careful and minerlike manner and in accordance with the applicable laws of the jurisdiction in which the Property is

located and indemnify and save the Optionor harmless from any and all claims, suits or actions made or brought against the Optionor as a result of work done by the Optionee on or with respect to the Property;

- (e) Maintain true and correct books, accounts and records of operations hereunder.
- (f) During the term of the Option, the Optionee shall pay all taxes, complete and file all assessment work and make all necessary payments and do such further and other acts as may be required to maintain the Property in good standing and shall not abandon or terminate the Option at any time less than 90 days prior to the date on which any act is required to maintain the Property in good standing.
- (g) provide to the Optionor copies of all news releases and other continuous disclosure documents filed or disseminated by the Optionee under securities laws of Canada and such other jurisdictions to which the Optionee may be subject which releases or documents shall comply with appropriate disclosure standards including, without limitation, NI 43-101..
- (h) Within 30 days after the end of each period within which expenditures are required ("Qualifying Expenditures") to be made by the Optionee to maintain this Option Agreement in good standing the Optionee and before earning an interest in accordance with the provisions of Sections 3.2 or 4.1 of this agreement, shall supply to the Optionor a geological or engineering report in writing reporting in detail as to the work conducted and a report of the Qualifying Expenditures made by the Optionee. Such report of Qualifying Expenditures shall, if required by the Optionors, be certified to by the Optionee's auditors.. Should such reports not be provided or should such reports not demonstrate expenditures sufficient to meet the required expenditures for the period covered by such report this Option Agreement may on notice in accordance with Section 16.1 terminate the Option and the Secondary Option., or, at the election of the Optionors, require additional Qualifying Expenditures to be made or require payment in lieu of such expenditures.

## **7. JOINT VENTURE**

- 7.1 Upon the Optionee earning its interest under 3.2 all operations shall be conducted on a joint venture basis the basic terms of which venture shall be as set forth in Schedule "B" or such further or other terms as the parties may agree upon.

## **8. TERMINATION OF OPTION**

8.1 In the event of default in the performance of the requirements of Section 3.1, then, subject to the provisions of Sections 8.2 and 16.1 of this Agreement, the Option and this Agreement shall terminate.

8.2 The Optionee shall have the right to terminate this Agreement by giving 30 days' written notice of such termination to the Optionors and upon the effective date of such termination this Agreement shall be of no further force and effect and the Optionee will have no further obligation to issue any

Shares or incur any further exploration expenditures on the Property, except the Optionee shall be required to satisfy any requirements which have accrued under the provisions of this Agreement which have not been satisfied.

8.3 Notwithstanding any other provisions of this Agreement, in the event of termination of this Agreement, the Optionee shall:

- (a) deliver to the Minera on any and all reports, samples, drill cores and engineering data of any kind whatsoever pertaining to the Property or related to Mining Work which have not been previously delivered to the Optionor;
- (b) upon notice from the Minera, remove all materials, supplies and equipment from the Property; provided however, that the Minera may retain ore and, at the cost of the Optionee, dispose of any such materials, supplies or equipment not removed from the Property within one hundred and eighty (180) days of receipt of such notice by the Optionee; and
- (c) ensure that, at the effective date of termination of this Agreement, the Property is free and clear of all liens and encumbrances arising from its operations hereunder (except liens contested in good faith by the Optionee) and in good standing for at least the next ensuing 12 months whether by having done and filed, or paid in lieu thereof, all assessment work necessary for that purpose.

## 9. CONFIDENTIALITY

9.1 All information and data concerning or derived from Mining Work shall be confidential and, except to the extent required by law or by regulation of any securities commission, stock exchange or other regulatory body, shall not be disclosed to any person other than a party's professional advisors without the prior written consent of the other party or parties, which consent shall not unreasonably be withheld.

## 10. NOTICE

10.1 Any notice, direction, or other instrument required or permitted to be given under this Agreement shall be in writing and shall be given by the delivery of same or by mailing same by prepaid registered or certified mail or by sending same by telegram, telex, telecommunication or other similar form of communication, in each case addressed to the intended recipient at the address of the respective party set out on the first page hereof.

10.2 Any notice, direction, or other instrument aforesaid will, if delivered, be deemed to have been given and received on the day it was delivered, and if mailed, be deemed to have been given and received on the fifth business day following the day of mailing, except in the event of disruption of the postal service in which event notice will be deemed to be received only when actually received and, if

sent by telegram, telecommunication or other similar form of communication, be deemed to have been given and received on the day it was actually received.

10.3 Any party may at any time give notice in writing to the others of any change of address, and from and after the giving of such notice, the address therein specified will be deemed to be the address of such party for the purposes of giving notice hereunder.

## **11. FURTHER ASSURANCES**

11.1 Each of the parties covenants and agrees, from time to time and at all times, to do all such further acts and execute and deliver all such further deeds, documents and assurances as may be reasonably required in order to fully perform and carry out the terms and intent of this Agreement.

## **12. AREA OF INTEREST**

12.1 If at any time during the subsistence of this Agreement either the Optionor or the Optionee stakes any mineral property located wholly or partly within the Area of Interest, such party give written notice of the acquisition of such Interest to the other party within 30 days of the acquisition which sufficiently describes the acquisition, including the cost thereof. Within 30 days of receiving such notice the non-acquiring party shall notify the acquiring party in writing as to whether or not it intends that the acquisition should become part of the Property. If the non-acquiring party fails to so notify the acquiring party within 30 days of receipt of the notice of the acquisition, then the acquisition shall be for the sole interest of the acquiring party and not subject to the terms of the option.

12.2 If the acquiring party is the Optionor and the Optionee has notified the Optionor of its intention that the acquisition should become part of the Property, the Optionee shall pay the Optionor within 30 days, the cost of acquisition. Upon payment of the cost of the acquisition by the Optionee, Minera and Optionee shall each become the beneficial owner of an interest in the acquisition (in the proportions set forth in this option in effect at the date of the acquisition ) and the acquisition will become part of the option and is subject to the terms of this option save and except for the provisions of this Article 12.

12.3 If the acquiring party is the Optionee and the Optionor has notified the Optionee of the intention that the acquisition should become part of the Property, Minera and the Optionee shall each become beneficial owner of an interest in the acquisition (in the proportions set forth in this option in effect at the date of the acquisition ) and the acquisition shall become part of the option and subject to the terms of the option, save and except for the provisions of this Article 12.

12.4 If an acquisition by the Optionee becomes part of the Property as provided for herein, the cost of the acquisition shall be credited towards the expenditures in Article 3.

## **13. TIME OF THE ESSENCE**

13.1 Time shall be of the essence in the performance of this Agreement.

#### **14. ENUREMENT**

14.1 This Agreement shall enure to the benefit of and be binding upon the parties and their respective successors and permitted assigns.

#### **15. FORCE MAJEURE**

15.1 No party will be liable for its failure to perform any of its obligations under this Agreement due to a cause beyond its reasonable control including, but not limited to, acts of God, fire, storm, flood, explosion, strikes, lockouts or other industrial disturbances, acts of public enemy, war, riots, laws, rules and regulations or orders of any duly constituted governmental authority, or non-availability of materials or transportation (each an "Intervening Event").

15.2 All time limits imposed by this Agreement will be extended by a period equivalent to the period of delay resulting from an Intervening Event.

15.3 A party relying on the provisions of Section 14.1 hereof, insofar as possible, shall promptly give written notice to the other party of the particulars of the Intervening Event, shall give written notice to all other parties as soon as the Intervening Event ceases to exist, shall take all reasonable steps to eliminate any Intervening Event and will perform its obligations under this Agreement as far as practicable, but nothing herein will require such party to settle or adjust any labour dispute or to question or to test the validity of any law, rule, regulation or order of any duly constituted governmental authority or to complete its obligations under this Agreement if an Intervening Event renders completion impossible.

#### **16. DEFAULT**

16.1 If a party (the "Defaulting Party") is in default of any requirement herein set forth, the party affected by such default (the "Non-Defaulting Party") shall give written notice to all other parties within thirty (30) days of becoming aware of such default, specifying the default, and the Defaulting Party shall not lose any rights under this Agreement, nor shall the Agreement or the Option terminate, nor shall the Non-Defaulting Party have any rights, remedies or cause of action pursuant to this Agreement, or otherwise hereunder as a result of such default, unless within ten (10) days after the giving of notice of default by the Non-Defaulting Party, the Defaulting Party has failed to cure the default by the appropriate performance, and if the Defaulting Party fails within such period to cure such default, the Non-Defaulting Party shall only then be entitled to seek any remedy it may have on account of such default.

## 17. TRANSFERS

17.1 The Optionee with the consent of the Optionors first had and obtained, such consent to be not unreasonably withheld, may at any time during the Option Period sell, transfer or otherwise dispose of all or any portion of its interest in the Property and/or its rights and obligations under this Agreement; provided that any purchaser, grantee or transferee of any such interest delivers to the Optionors its agreement related to this Agreement and to the Property, containing:

(a) a covenant by such transferee to perform all the obligations of the Optionee to be performed under this Agreement in respect of the interest to be acquired by it from the Optionee to the same extent as if this Agreement had been originally executed by such transferee as principal obligant; and

(b) a provision subjecting any further sale, transfer or other disposition of such interest in the Property and/or this Agreement or any portion thereof to the restrictions contained in this section;

and further provided that any shares delivered to the Optionor in connection with the exercise of the Option must be shares of the Optionee, unless otherwise agreed in writing by the Optionor.

1702 No assignment by the Optionee of any interest less than its entire interest in this Agreement shall, as between the Optionee and the Optionor, discharge it from any of its obligations hereunder, but upon the transfer by the Optionee of the entire interest at the time held by it in this Agreement (whether to one or more transferees and whether in one or in a number of successive transfers), the Optionee shall be deemed to be discharged from all obligations hereunder save and except for obligations which arose prior to the date of transfer.

17.3 If the Optionor or the Optionee (the "Vendor") should at any time after exercise of the Option receive a bona fide offer from an independent third party (the "Proposed Purchaser") dealing at arm's length with the Vendor to purchase all or substantially all of its interest in and to the Property, which offer the Vendor desires to accept, or if the Vendor intends to sell all or substantially all of its interest in and to the Property, the Vendor shall first make an offer (the "Offer") of such interest in writing to the other party (the "Offeree") upon terms no less favourable than those offered by the Proposed Purchaser or intended to be offered by the Vendor, as the case may be.

17.4 Each Offer shall specify the price and terms and conditions of such sale, the name of the Proposed Purchaser (which term shall, in the case of an intended offer by the Vendor, mean the person or persons to whom the Vendor intends to offer its interest) and, if the offer received by the Vendor from the Proposed Purchaser provides for any consideration payable to the Vendor or otherwise than in cash, the Offer shall include the Vendor's good faith estimate of the cash equivalent of the non-cash consideration.

17.5 If within a period of 60 days of the receipt of the Offer the Offeree notifies the Vendor in writing that it will accept the same, the Vendor shall be bound to sell such interest to the Offeree (subject as hereinafter provided with respect to price) on the terms and conditions of the Offer.

17.6 If the Offer so accepted by the Offeree contains the Vendor's good faith estimate of the cash equivalent consideration as aforesaid, and if the Offeree disagrees with the Vendor's best estimate, the Offeree shall so notify the Vendor at the time of acceptance and the Offeree shall, in such notice, specify what it considers, in good faith, the fair cash equivalent to be and the resulting total purchase price.

17.7 If the Offeree so notifies the Vendor, the acceptance by the Offeree shall be effective and binding upon the Vendor and the Offeree and the cash equivalent of any such non-cash consideration shall be determined by binding arbitration under the Commercial Arbitration Act of British Columbia and shall be payable by the Offeree, subject to prepayment as hereinafter provided, within 60 days following its determination by arbitration; and the Offeree shall in such case pay to the Vendor, against receipt of an absolute transfer of clear and unencumbered title to the interest of the Vendor being sold, the total purchase price which is specified in its notice to the Vendor and such amount shall be credited to the amount determined following arbitration of the cash equivalent of any non-cash consideration.

17.8 If the Offeree fails to notify the Vendor before the expiration of the time limited therefor that it will purchase the interest offered, the Vendor may sell and transfer such interest to the Proposed Purchaser at the price and on the terms and conditions specified in the Offer for a period of 60 days, provided that the terms of this paragraph shall again apply to such interest if the sale to the Proposed Purchaser is not completed within the said 60 days.

17.9 Any sale hereunder shall be conditional upon the Proposed Purchaser delivering a written undertaking to the Offeree, in form and substance satisfactory to its counsel, to be bound by the terms and conditions of this Agreement.

## **18. SEVERABILITY**

18.1 If any one or more of the provisions contained herein should be invalid, illegal or unenforceable in any respect in any jurisdiction, the validity, legality and enforceability of such provisions shall not in any way be affected or impaired thereby in any other jurisdiction and the validity, legality and enforceability of the remaining provisions contained herein shall not in any way be affected or impaired thereby.

## **19. AMENDMENT**

19.1 This Agreement may not be changed orally but only by an agreement in writing, signed by the party against which enforcement, waiver, change, modification or discharge is sought.

## **20. ENTIRE AGREEMENT**

20.1 This Agreement constitutes and contains the entire agreement and understanding between the parties and supersedes all prior agreements, memoranda, correspondence, communications, negotiations and representations, whether oral or written, express or implied, statutory or otherwise between the parties or any of them with respect to the subject matter hereof. In particular, Almaden agrees that the agreements of Lincoln as set forth in this Agreement replace and supercede the obligations of Lincoln under the original letter of intent dated August 5, 2005, including the obligations

of Lincoln to issue to Almaden 70,000 shares on August 5, 2007, 80,000 shares on August 5, 2008 and 90,000 shares on August 5, 2009.

## 21. OPTION ONLY

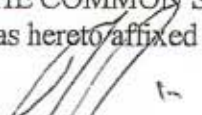

21.1 This Agreement provides for an option only, and except as specifically provided otherwise, nothing herein contained shall be construed as obligating the Optionee to do any acts or make any payments hereunder and any act or acts or payment or payments as shall be made hereunder shall not be construed as obligating the Optionee to do any further act or make any further payment.

## 22. GOVERNING LAW AND ARBITRATION

22.1 This Agreement shall be governed by and interpreted in accordance with the laws of the Province of British Columbia and the federal laws of Canada applicable therein and the parties hereby irrevocably attorn to the jurisdiction of the Courts and mediation/arbitral authorities of the Province of British Columbia.

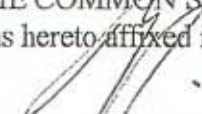

22.2 Any dispute arising between the parties shall if possible be settled by mediation. Failing resolution by mediation, the matter shall be determined by binding arbitration conducted under the Commercial Arbitration Act (British Columbia) and the place of arbitration shall be Vancouver, British Columbia.

## CERTIFICATE HE05060300

Project: *BUFA PROJECT, CHIHUAHUA, MX*

P.O. No.:

This report is for 16 Rock samples submitted to our lab in Chihuahua, CHIHUAHUA, Mexico on 25-JUL-2005.

The following have access to data associated with this certificate:

RICHARD W. BYBEE

JEFF WILSON

## SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um

## ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Hg-CV41	Trace Hg - cold vapor/AAS	FIMS
ME-ICP61	27 element four acid ICP-AES	ICP-AES
Ag-AA62	Ore grade Ag - four acid /AAS	AAS
Au-AA25	Ore Grade Au 30g FA AA finish	AAS

To: LINCOLN GOLD CORP.  
ATTN: JEFF WILSON  
325 TAHOE DRIVE  
CARSON CITY NV 89703

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

Rock Sample Data Sheet											
La Bufa Concession, Guadalupe y Calvo, Mexico											
Lincoln Gold Corp.											
Samples collected by J. Wilson & R. Bybee: 7/16-18/05											
Coordinates are UTM NAD 27 Mexico, Zone 13											
Samples were analyzed at Chemex using ME-ICP61											
See Figure A for Location Map											
Sample id	Au ppm	Ag ppm	easting	northing	elev (m)	sample type*	sample length (m)	structure	sampled	sample descriptions	location
B001	0.04	0.5	305110.00	2886216.00	2323	cc	3.05	110	-70	silicified/argillic altered vol. (andesite), w/qtz stringers and banded/bx qtz veins to 2' thick	roadcut at east end of district, FW of zone
B002	0.05	<0.5	305108.00	2886213.00	2323	cc	3.05	110	-70	granular qtz and silicified andesite in argillic grndms	roadcut at east end of district, FW of zone
B003	0.07	0.5	305112.00	2886219.00	2323	cc	2.44	110	-70	granular qtz and silicified andesite in argillic grndms	roadcut at east end of district, FW of zone
B004	0.18	13.2	305085.00	2886163.00	2324	cc	3.05	110	-70	mixed argillized/silicified andesite w/tr dis py and includes a 2' qtz vein	roadcut at east end of district, HW of zone
B005	0.35	35.1	305085.00	2886166.00	2324	cc	3.05	110	-70	mixed argillized/silicified andesite wallrock w/py to 1% in qtz veins and stringers, sheared	roadcut at east end of district, HW of zone
B006	0.26	22.2	305085.00	2886169.00	2324	cc	2.74	110	-70	vein zone w/qtz vein and intense silicification and dis py to 0.5% over 3'	roadcut at east end of district, HW of zone
B007	0.55	68.3	305085.00	2886167.00	2324	sl	0.00	110	-70	select of qtz-sul vein between samples B005-B006	roadcut at east end of district, HW of zone
B008	5.30	94.0	304709.13	2886837.60	2297	dp	0.00			grab of banded qtz/qtz bx vein material w/py from several hand sorted dumps at prospect adit	in stream bottom west side of Chapilito block
B009	0.06	1.9	305196.82	2886307.78	2332	cc	0.91	70	-90	0.8' of qtz-py vein in 2.2' of sheared and argillic andesite	roadcut at east end of district, FW of zone
B010	0.07	3.3	305048.77	2886292.11	2356	gr	0.00			silicified and qtz veins in andesite wallrock w/FeOx after py, old "digs" in area of subcrop/outcrop	hill west of main road
B011	0.05	2.1	305042.63	2886337.56	2372	gr	0.00			silicified and qtz veins in andesite wallrock w/FeOx after py, old "digs" in area of subcrop/outcrop	hill west of main road
B012	0.02	0.9	305065.69	2886493.09	2395	gr	0.00			silicified and qtz veins in andesite wallrock w/FeOx after py, old "digs" in area of subcrop/outcrop	hill west of main road
B013	0.20	10.7	304858.53	2886707.02	2386	gr	0.00			silicified and qtz veins in andesite wallrock w/FeOx after py area of subcrop/outcrop	50m west of steel building at top of hill
B014	7.96	169.0	UG			UG / cc	2.44	180	-55	vein qtz and gouge, qtz bx mixed with wall rock silicified andesite(?) bx	Rosario workings, FW vein at 303m from portal
B015	0.49	55.1	UG			UG / cc	1.83	110	-45	mx qtz bx and intense silicified andesite wallrock, FeOx after sul	Rosario workings, pillar at 159m from portal
B016	1.12	75.3	UG			UG / cc	1.83	110	-40	mx qtz bx and banded vein in intensely silicified andesite wallrock, FeOx after sul	Rosario workings, pillar at 115m from portal
*Sample Type:											
			cc = continuous chip on outcrop								
			gr = grab of rock over area of outcrop/subcrop								
			UG = underground rock chip								
			dp = rock from mine or prospect dumps								
			sl = select rock sample

## CERTIFICATE CH06093087

Project: La Bufa

P.O. No.:

This report is for 110 Soil samples submitted to our lab in Chihuahua, CHIHUAHUA, Mexico on 22-SEP-2006.

The following have access to data associated with this certificate:

RICHARD W. BYBEE

JEFF WILSON

## SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

## ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	34 Element Aqua Regia ICP-AES	ICP-AES
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES

To: LINCOLN GOLD CORP.  
ATTN: JEFF WILSON  
325 TAHOE DRIVE  
CARSON CITY NV 89703

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

## CERTIFICATE CH06093086

Project: La Bufa

P.O. No.:

This report is for 150 Soil samples submitted to our lab in Chihuahua, CHIHUAHUA, Mexico on 22-SEP-2006.

The following have access to data associated with this certificate:

RICHARD W. BYBEE

JEFF WILSON

## SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

## ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	34 Element Aqua Regia ICP-AES	ICP-AES
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES

## CERTIFICATE CH06093085

Project: La Bufa

P.O. No.:

This report is for 150 Soil samples submitted to our lab in Chihuahua, CHIHUAHUA, Mexico on 22-SEP-2006.

The following have access to data associated with this certificate:

RICHARD W. BYBEE

JEFF WILSON

## SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

## ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	34 Element Aqua Regia ICP-AES	ICP-AES
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES

To: LINCOLN GOLD CORP.  
ATTN: JEFF WILSON  
325 TAHOE DRIVE  
CARSON CITY NV 89703

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

## CERTIFICATE CH06093084

Project: La Bufa

P.O. No.:

This report is for 150 Soil samples submitted to our lab in Chihuahua, CHIHUAHUA, Mexico on 22-SEP-2006.

The following have access to data associated with this certificate:

RICHARD W. BYBEE

JEFF WILSON

## SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
SCR-41	Screen to -180um and save both

## ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-ICP41	34 Element Aqua Regia ICP-AES	ICP-AES

To: LINCOLN GOLD CORP.  
ATTN: JEFF WILSON

## CERTIFICATE HE06095216

Project: LA BUFA

P.O. No.:

This report is for 133 Soil samples submitted to our lab in Hermosillo, SONORA, Mexico on 27-SEP-2006.

The following have access to data associated with this certificate:

RICHARD W. BYBEE

JEFF WILSON

## SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rod w/o BarCode
SCR-41	Screen to -180um and save both

## ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-ICP41	34 Element Aqua Regia ICP-AES	ICP-AES

To: LINCOLN GOLD CORP.  
ATTN: JEFF WILSON
