NEWS

FOR IMMEDIATE RELEASE

JET GOLD REPORTS POSITIVE RESULTS AT FUNK #2

January 11, 2007 - Jet Gold Corp. (TSXV:JAU) is pleased to report that operator, Horizon Industries Ltd. (TSXV:HRZ) ("Horizon"), reported that its drilling, logging and core sampling of the Funk #2 well in Goliad County, Texas are now complete. Four and one-half (4.5) inch production casing was set to a depth of 6,050 feet.

The well was drilled to a total depth of 6,060 feet on Thursday morning, January 4, 2007. Electric logging was delayed until mid day Friday, January 5th, while the well was conditioned with heavier mud to control over pressure from the geo-pressured formation (4,200 psi bottom hole pressure) and to circulate out gas flowing into the well bore. A mud weight of 13.4 lbs was required to stabilize the well.

The well was logged using a High Definition Induction tool with a compensated neutron and density log. Interpretation of the logs and side wall cores by R. W. Dirks Petroleum Engineer, Inc. shows four significant potential producing zones and two additional zones of interest for later exploration.

The target zone, (the Yegua Formation), was intersected from a depth of 5,580 ft to 5,680 ft with gross pay of 102 feet of laminated sands. The side wall cores and logs show the development of significant porosity (28% to 30%) and permeability (500 md) at intervals throughout the zone. Side wall cores contained condensate with associated gas, and in one interval 34 to 37 degree API gravity oil. The logs and cores are analogous to the nearby Vrazel #1 well located 1.6 miles to the northeast in the Perdido Creek Field. This well produced from a similar Yegua zone over an interval of approximately 45 feet covering 35 acres. The Vrazel #1 had cumulative production of 1.7 BCF and 28,000 bbl of condensate with average monthly production rates as high as 2,700 mcf per day plus 72 bbl of condensate. The Yegua structure at the Funk #2 well is approximately 102 ft over 50 acres.

The secondary zone occurs in the Cook Mountain Formation at a depth of 5,820 ft -- 5,840 ft and shows total pay over 12 ft. The cores show permeability from 200 -- 400 millidarcies and porosity ranging up to 29%. The side wall cores in this zone contain condensate together with associated gas.

Two further well developed gas sands appear in the Frio Formation having net pay of approximately 22 ft and 8 ft respectively. These zones occur between 3,121 ft -- 3,129 ft and 3,210 ft - 3,278 ft. Side wall cores indicate gas as the probable production with permeabilities ranging from 150 -- 500 millidarcies and porosities of up to 42%.

Subject to weather and service rig availability, it is anticipated that the well will be perforated and flow tested within the next 10 days.

There are six additional prospective well locations at the Funk prospect and Horizon plans to drill up to four additional wells at Funk over the balance of the winter and through the spring.

Jet Gold has a 5.0% working interest in the Funk Prospect.

Funk Prospect

The Funk Prospect is located in the G. Barrera survey A-2 in Goliad County and comprises approximately 500 acres. The Funk Prospect is situated in the prolific Middle Yegua gas trend, a formation that has produced gas and condensate in the nearby Maetze Yegua, Perdido Creek and Jobar fields. The Funk prospect currently has two producing wells, the Funk #1 and #3 wells.

NEWS

FOR IMMEDIATE RELEASE

STRONG INITIAL FLOW RESULTS AT FUNK #2 – TIE IN TO SALES PROCEEDING

January 19, 2007 - Jet Gold Corp (TSXV:JAU) and the operator, **Horizon Industries Ltd.** (TSXV:HRZ), are pleased to announce it has perforated and tested the first of four pay zones in the Funk #2 well in Goliad County, Texas.

Log results reported in the Company's news release dated January 11, 2007 showed four highly prospective pay zones in the well; two upper zones between 3,121 feet to 3,278 feet; the primary pay zone in the Yegua formation from 5,580 feet to 5,680 feet; and a secondary pay zone in the Cook Mountain formation from 5,820 feet to 5,840 feet.

The well was perforated on January 18, 2007 in its lowermost, secondary pay zone over six feet from 5,823 ft. to 5,829 ft. The well flowed natural gas at the rate of 925 mcf per day on an 8/64ths choke with flow tubing pressure of 2,650 psi. A four point flow test is scheduled for today and tie in to sales is scheduled for completion by on or about Friday, January 26, 2007. Plans are to produce from this zone until depleted, after which time work will commence to test and produce from the primary pay zone located further up hole in the Yegua formation where the bulk of production is expected from this well.

There are six additional prospective well locations at the Funk prospect, with further plans to drill up to four additional wells at Funk over the balance of the winter and through the spring.

The planned farm out program has been completed and Jet Gold currently hold a 5.0% interest in the Funk Prospect.

Funk Prospect

The Funk Prospect is located in the G. Barrera survey A-2 in Goliad County and comprises approximately 500 acres. The Funk Prospect is situated in the prolific Middle Yegua gas trend, a formation that has produced gas and condensate in the nearby Maetze Yegua, Perdido Creek and Jobar fields. NEWS

FOR IMMEDIATE RELEASE

JET GOLD SIGNS DIAMOND DRILL CONTRACT, APPOINTS CO-ORDINATOR

January 25, 2007 - Jet Gold Corp., TSXV:JAU, (the "Company") reports that it has negotiated a diamond drilling contract with Driftwood Diamond Drilling Ltd. ("Driftwood"), of Smithers, B.C. for drilling of the Naskeena Coal Project. Driftwood has extensive experience in North Western British Columbia to projects in the Andes of South America, Southeast Asia and the Caribbean. Through the use of support equipment, Driftwood has the ability to build pads, roads, camps and other projects necessary for the efficient completion of a project. The contract calls for drilling with NQ and BQ cores over the Company's 4500 hectare Naskeena Coal Project located 27 miles north of Terrace, B.C. and just over 100 miles from the Prince Rupert, Ridley Island ocean shipping coal terminal. The goal of the drilling is to verify an inferred resource of 200 million tons of high grade smokeless thermal coal reported by G.F. Monckton in his 1913 report. Drilling is scheduled to start in late February or early March, depending on local weather conditions.

Coincident with the signing of this contract, the Company is also pleased to report the appointment of Douglas McRae, RFT. as Project Coordinator. Mr. McRae has 18 years of experience within multi discipline engineering environments, as well as, experience with the current regulatory environment in British Columbia. He has worked primarily in the forest industry with direct involvement as project coordinator on many projects. These projects have included strategic planning of resource extraction, resource valuation and mitigation of environmental impacts. Mr. McRae will coordinate the movement of personnel, equipment and supplies to the Naskeena Project. It is expected that the exploration and development will continue throughout the summer. As part of his duties, Mr. McRae will also establish an Environmental Management System (EMS) as part of Jet Gold's commitment to the responsible use and management of British Columbia's natural resources.

The Company has granted Mr. McRae an employee incentive stock option of 75,000 shares in accordance with the Company's Incentive Stock Option Plan.
