

Corvidane

A novel approach to treating
Cardiovascular and Liver diseases

June 12th, 2023

PROBLEM

Diseases of lipid metabolism + inflammation:

Atherosclerosis

The buildup of **fats** and **cholesterol** (i.e., plaque) in artery walls that, when accompanied by **inflammation**, obstructs blood flow.

A major factor in **heart attacks** and **strokes**, the leading causes of death globally

Nonalcoholic Steatohepatitis

An accumulation of excess **liver fat** accompanied by **inflammation** and cell damage, which can cause fibrosis and lead to cirrhosis and liver cancer.

NASH affects 5% of U.S. adults and is the leading cause of **liver transplants** in the U.S.

SOLUTION

A drug that is safe and can improve lipid metabolism and reduce inflammation

Corvida™ contains two fatty acids: an **Omega-7** and an **Omega-9**.
Both are Generally Recognized as Safe (GRAS) by the FDA.

OMEGA-7 (palmitoleic acid)

- Associated with preventing atherosclerosis and non-fatal heart attacks.
- Improves metabolic function of the liver and associated with improved insulin sensitivity.

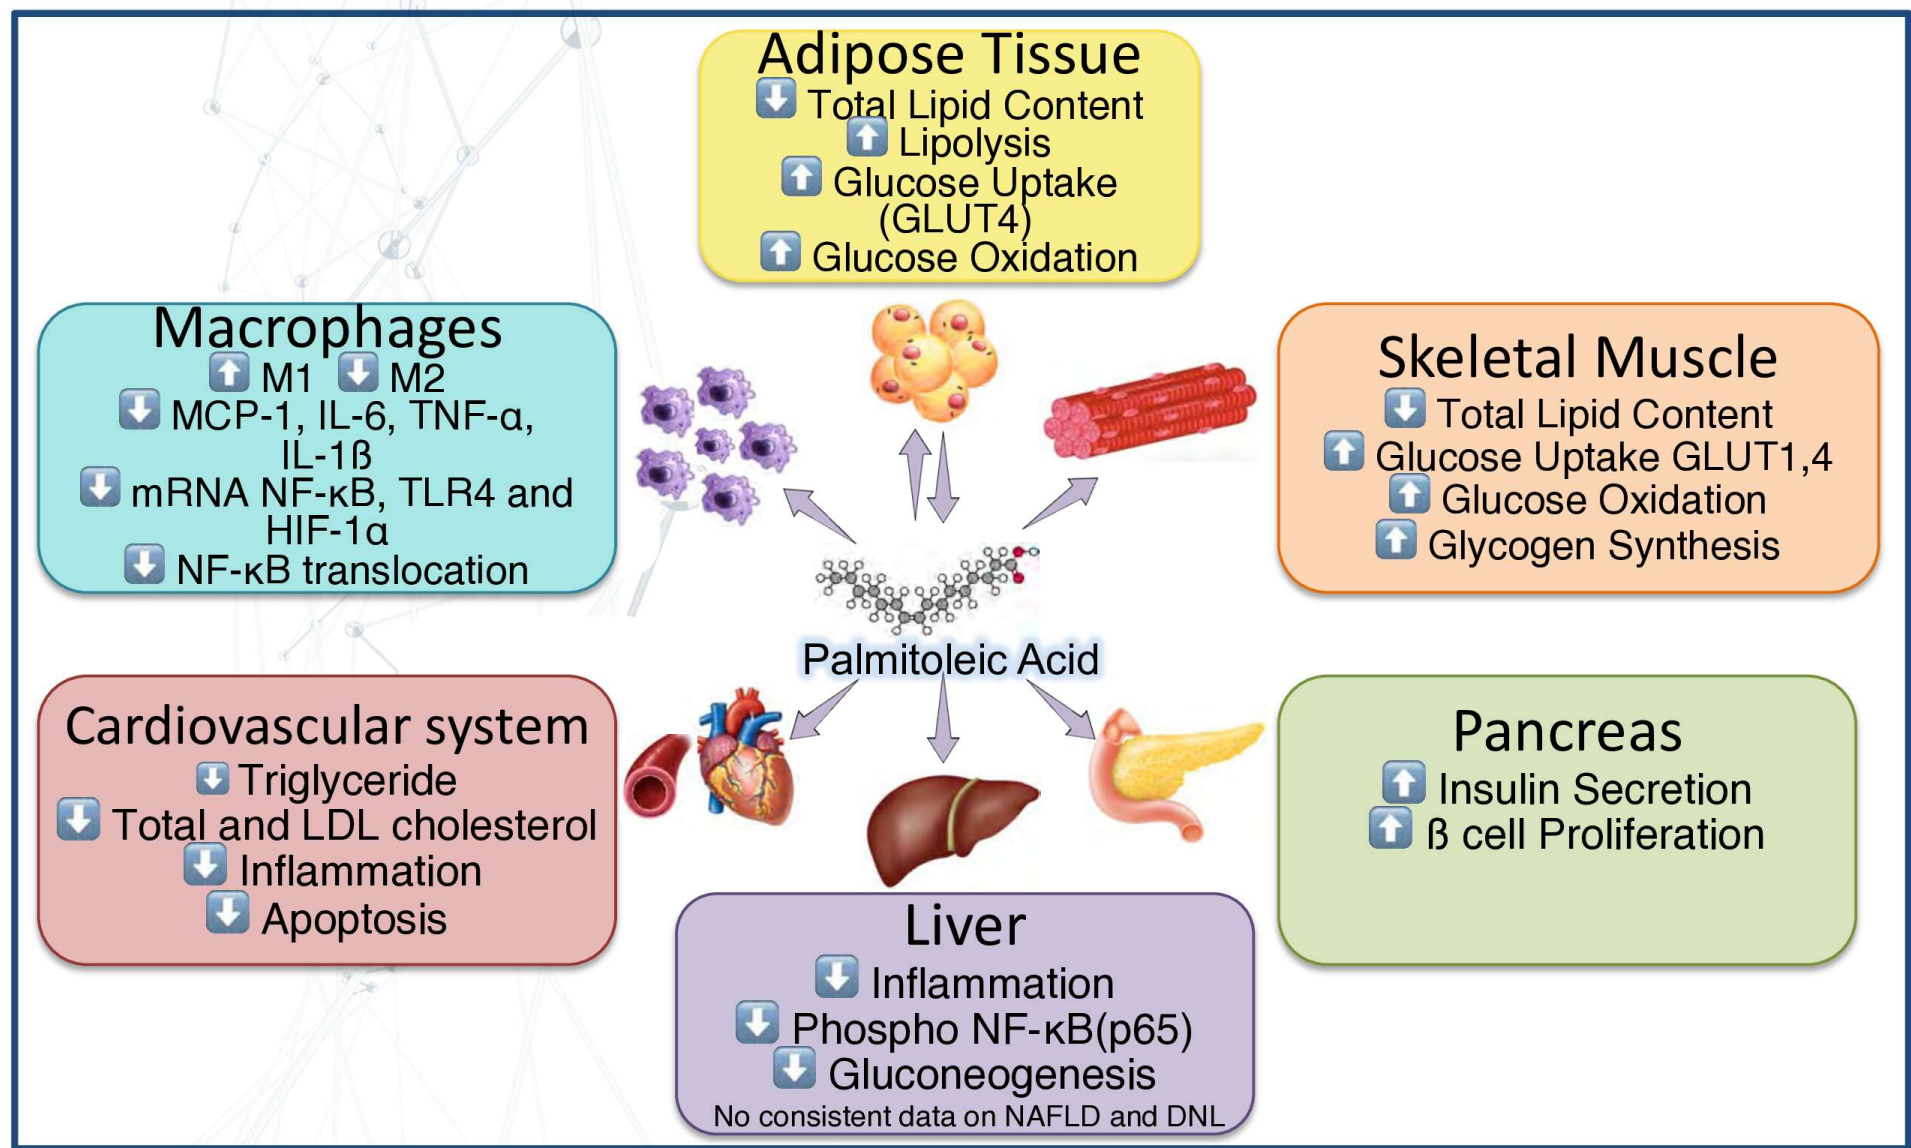

OMEGA-9 (oleic acid)

- Associated with low blood pressure.
- Has beneficial effects on autoimmune and inflammatory diseases.

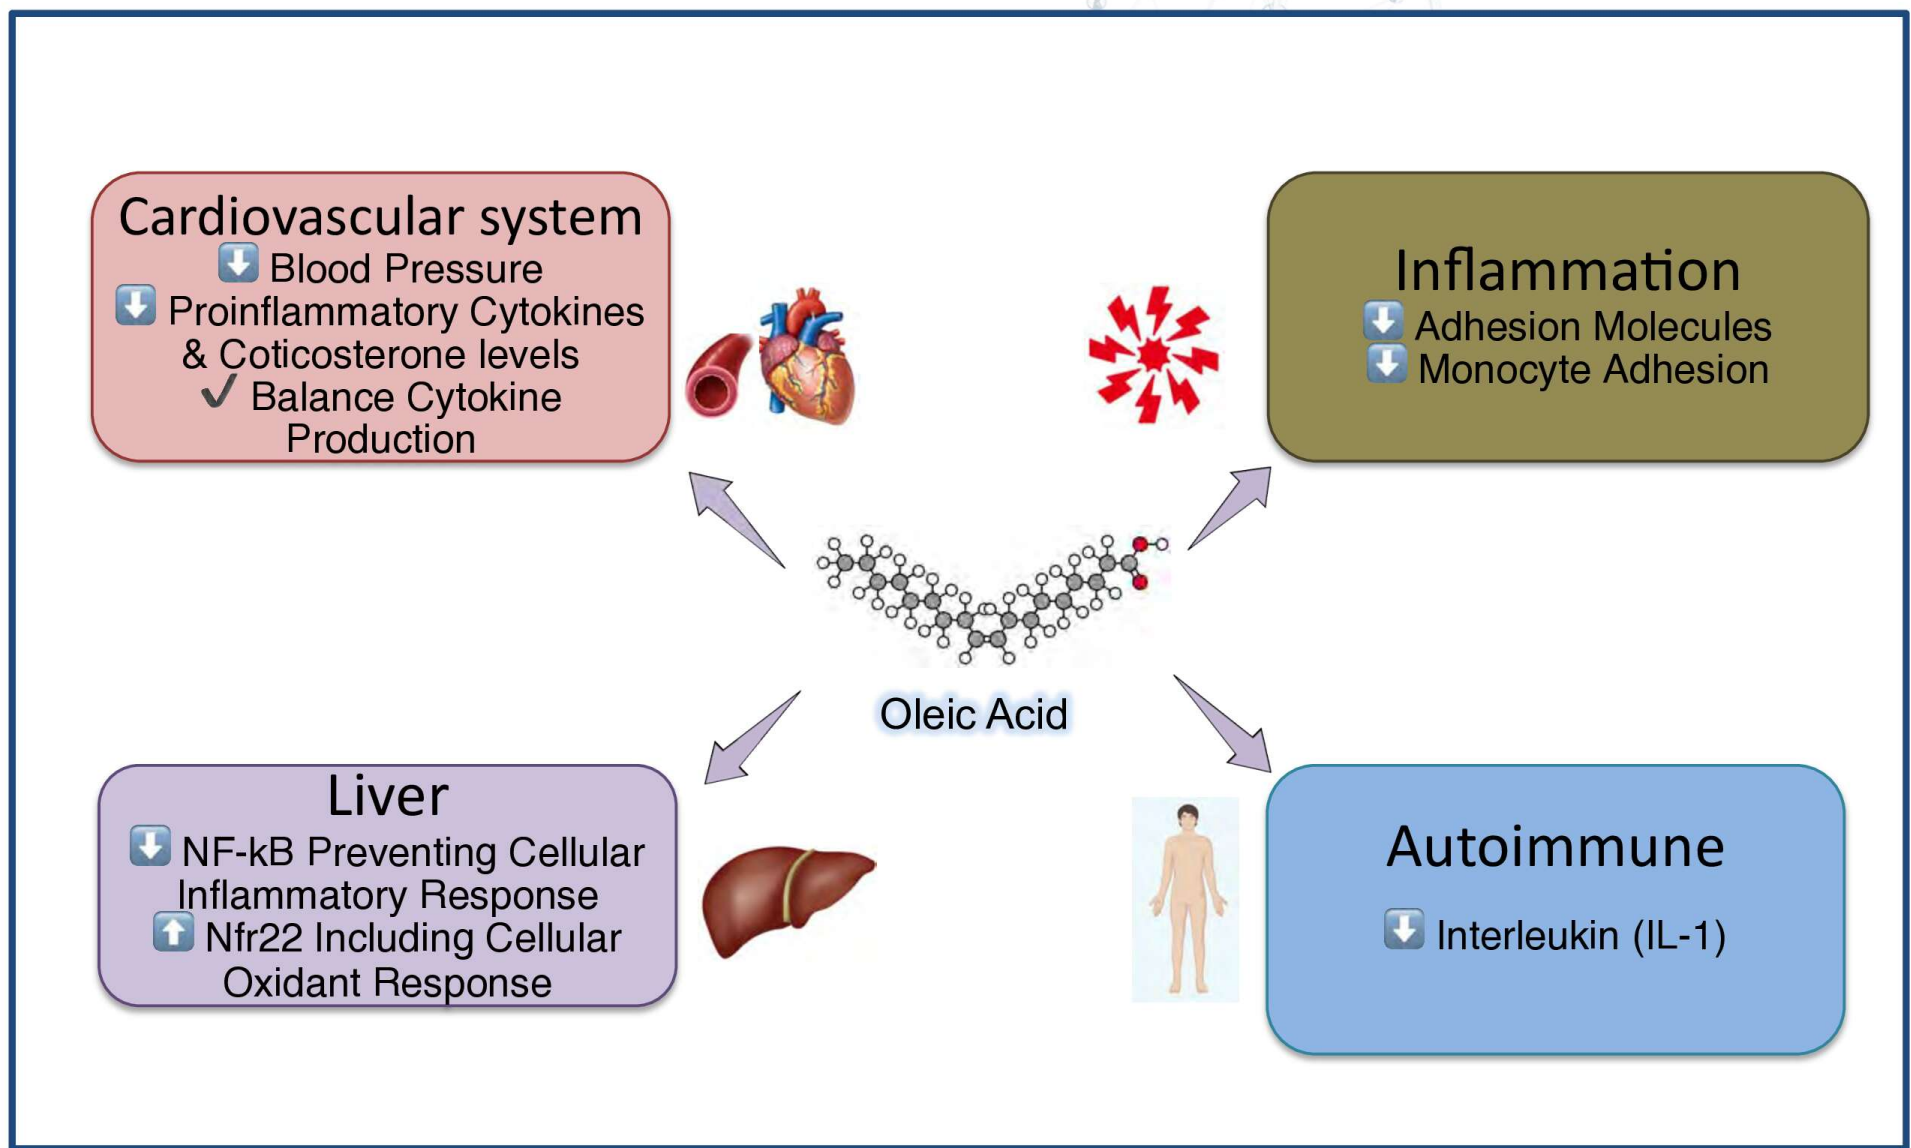

SOLUTION

Palmitoleic Acid (Omega-7)

Oleic Acid (Omega-9)

SOLUTION

We selected Omega-7s and Omega-9s that improve lipid metabolism and have anti-inflammatory properties to maximize the health benefit via multiple pathways.

Fatty Acid	Omega	Size	Double Bonds
Palmitoleic	7	16 Carbon Atoms	1
Oleic	9	18 Carbon Atoms	1
EPA	3	20 Carbon Atoms	5
DHA	3	22 Carbon Atoms	6

Omega-7 and Omega-9 fatty acids are smaller and more capable of entering cells than Omega-3s.

Corvida™ is not an Omega-3 fatty acid drug, which is often used to reduce triglyceride levels in the body.

Omega-7 and Omega-9 fatty acids have fewer double bonds (**Mono-unsaturated**) and are less easily oxidized or otherwise damaged.

\$30B (Peak)

ATHEROSCLEROSIS

Targeting at-risk population actively using cholesterol lowering (statin) therapies.

MARKETS

\$27B (Est)

NASH

Targeting NASH patients with or without Type 2 diabetes.

UP TO 60% OF
TYPE 2
DIABETICS HAVE
NAFLD OR NASH

COMPETITION

AMARIN

Vascepa®
(Icosapent Ethyl)

ATHEROSCLEROSIS

- Purified Eicosapentaenoic Acid (EPA), an omega-3 fatty acid, **not Monounsaturated**
- Originally approved to lower triglycerides
- Shows most potential of approved drugs to treat atherosclerosis (EVAPORATE study)
- **Does not provide benefit in NASH**

northsea
THERAPEUTICS

Icosabutate

NASH

- Modified Eicosapentaenoic Acid (EPA), an omega-3 fatty acid, **not Monounsaturated**
- Currently in Phase 2 human studies targeting NASH patients with F2-F3 fibrosis
- Reduces triglyceride levels, **but may increase LDL cholesterol levels**

M&A ACTIVITY

Corvida™:

SELL, LICENSE OR PUBLIC EXIT

Promising fatty acid

THERAPEUTICS

Pfizer

HLS Therapeutics Inc.
Pfizer enters into
promotional agreement
with HLS Therapeutics
for Vascepa® in Canada

Gilead combined
Amarin's omega-3 fatty
acid drug Vascepa® for
inclusion in their NASH
combo therapy trials

AMARIN

Ωmthera
Pharmaceuticals

Astra Zeneca acquired
Omthera for **\$343M**
for their omega-3 fatty
acid drug Epanova®

AstraZeneca

GILEAD

VALIDATION

Corvida™ studies have shown promising results:

Ability to treat Atherosclerosis and NASH simultaneously in the LDLr-/- mouse model (awaiting results).

Reduction in Atherosclerotic Plaque in the ApoE-/- mouse model.

Improved metabolic processing of lipids in rodent model.

Effects on Atherogenic Lipids in Humans.

Effects on Atherogenic Lipids in ApoE3 mouse model.

INTELLECTUAL PROPERTY

Intellectual Property:

Patents to treat Atherosclerosis Issued:

- The United States

- Japan

- Brazil

...w/ applications pending in The EU, China, India and Canada.

- NASH provisional application filed in the U.S.

TEAM

Dr. Paresh Soni, MD, PhD – CEO & Chief Medical Officer

An expert in **NASH** with 20+ years executive pharmaceutical experience, including **Amarin**, Alexion, Pfizer and Albireo. Led NDA approval of Vascepa®.

Damion J. Boyer – Co-Founder & COO

6 years as Corvidane CEO. Initiated Corvidane's NASH program and forged strategic alliances in the U.S. and Europe.

Patrice Binay, PhD – Vice President of Chemistry and Manufacturing

32 years of pharmaceutical fine chemistry experience.

Menno Van Burken, PharmD – Vice President of Commercial Strategy

32 years of pharmaceutical experience, including 17 years with Pfizer.

John M. Burke - Co-Founder and Inventor of Corvida™

46 years chemical engineering expertise.

OFFERING

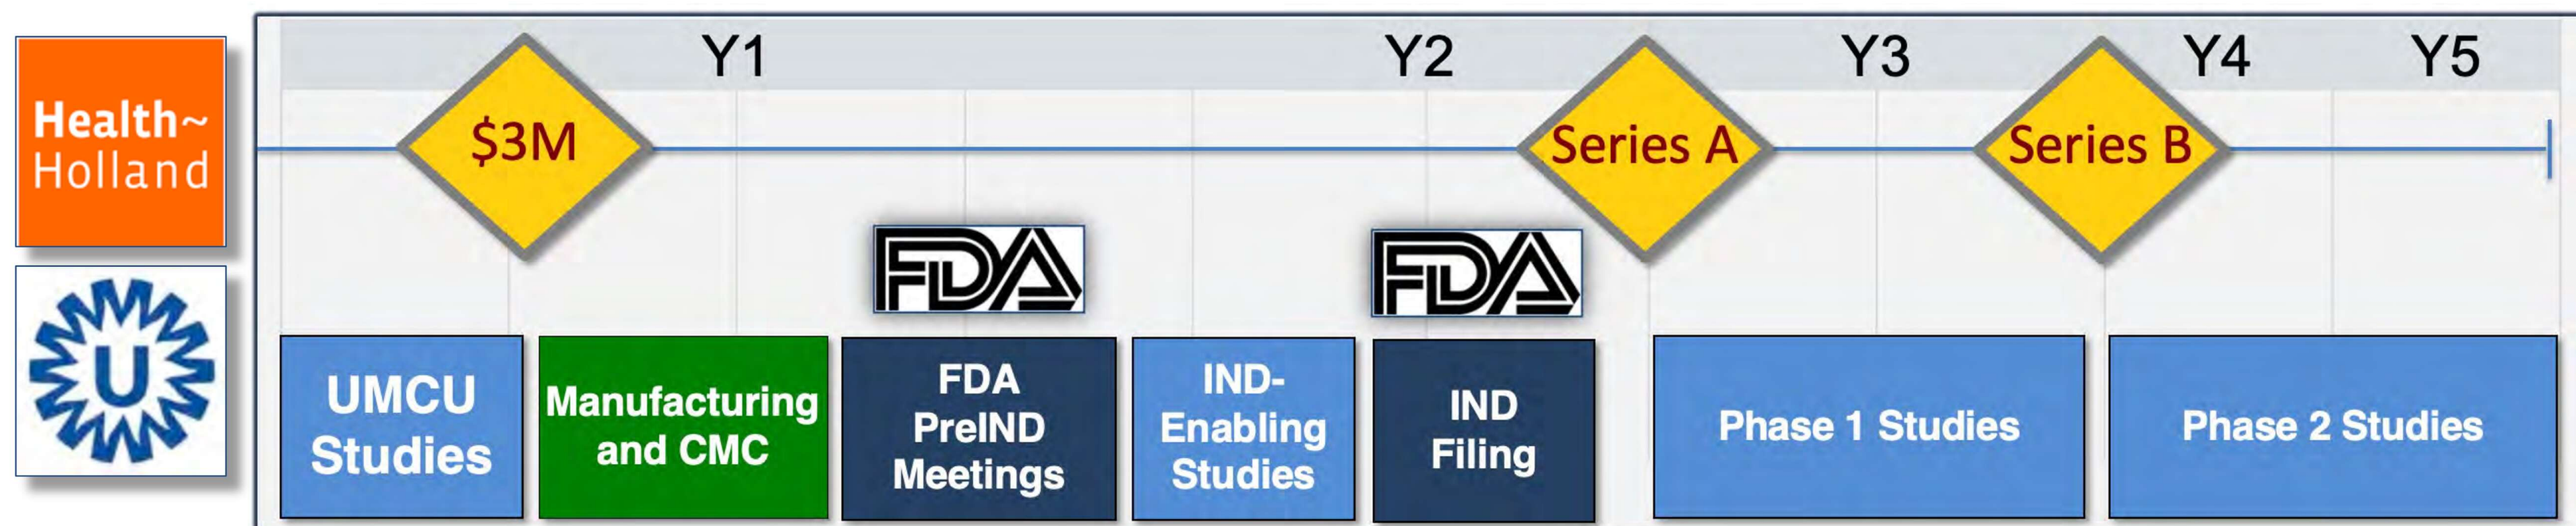

RAISING \$3M USD to Submit an Investigation New Drug (IND) Application

- Equity or Convertible Note

Funds will be used to cover:

- Toxicological Studies
- Manufacturing/CMC
- Legal/Patents, Accounting, Market Research, Personnel

Raised \$360k with RegCF and €600k from TKI Subsidy for collaboration with UMC Utrecht

CONCLUSION

- Low valuation for early investors with potential for upside with 2 large indications.
- Potential to treat millions of patients with common metabolic diseases.

Corvidane

THANK YOU

“We will meet the challenge.” – Dr. Oheneba Boachie-Adjei

Research

Effects on Atherosclerosis in Rodents The Cleveland Clinic

Mouse Atherosclerosis Progression Study

- Examined the effects Corvida™ (CCO) diet vs. Western Diet in ApoE^{-/-} mice; a well-established model for atherosclerotic progression
- Corvida™ diet replaced 20% standard Western diet fat with Corvida™:
 - Corvida™ increased HDL cholesterol by 77% compared to the control group
 - Corvida™ reduced triglycerides by 11% compared to control group
 - Corvida™ produced significant reductions in atherosclerosis
 - Effect on atherosclerosis versus atherogenic lipid suggests beneficial effects beyond lipids

Table 2. Aortic sinus lesion size (mm ²)		
	Control	Treatment
Corvida™	0.33 ± 0.09	0.18 ± 0.07**

Table 3. Aortic lesion (%)		
	Control	Treatment
Corvida™	9.63 ± 2.8	3.17 ± 1.6**
†Rosuvastatin (20mg/kg/day ²)	21.9 ± 2.9	11.9 ± 1.9*

Compared to the Control group, *P<0.05, **P<0.001

Research

Effects on Atherogenic Lipids in Humans The University of Hawaii

Human Dietary Study

- Used macadamia nuts (high in oleic and palmitoleic acids) compared to typical Western diet
- Subjects were relatively healthy volunteers with well-controlled lipids at baseline (mean baseline LDL-C levels of 130 mg/dl; mean baseline TGs of 80 mg/dl)
- With macadamia nut diet:
 - LDL-C was 5.9 mg/dl lower than American diet ($p < 0.05$)
 - TGs were 7.1 mg/dl lower than American diet ($p < 0.05$)
 - Non-HDL-C is calculated to be 7.4 mg/dl lower than American diet
- Macadamia nut diet was safe and well-tolerated

Effects on Atherogenic Lipids in Rodents TNO

ApoE3* Leiden Mouse Model Lipids Study

- ApoE3* Leiden mouse model is a well-established and validated model for human dyslipidemia and progression of atherosclerosis
- Martek algae oil was tested to western diet. Specifically, 6% Martek algae oil replaced 6% of cacao butter in the Western diet (which is 15% cacao butter).
 - Martek algae oil is highly enriched in palmitoleic acid and palmitic acid
- As compared to Western diet, Martek algae oil at 4 weeks
 - Reduced total cholesterol by 37%
 - Reduced TGs by 44%

Research

Improved Metabolic Processing of Lipids Case Western Reserve University

Study of Corvida™ in an Animal Model

Double blind, 8-week study of 18 Sprague Dawley rats receiving 50% of calories from fat to resemble typical American diet (40%-45% of calories from fat). Three arms of 6 rats each:

1. Corvida™ Diet
2. Saturated Fat Diet - Lauric acid (C12:0) and Myristic acid (C14:0)
3. Oleic acid (C18:1)

Lead Investigator: Dr. Charles Hoppel, M.D.

Results/Conclusions:

- Corvida™'s constituents absorbed into the blood and heart, liver and adipose tissue
- Corvida™ improves metabolic processing of lipids and glucose resulting in reduced liver fat accumulation and sustained liver function.
