

if you are here in the garden you walk  
goats walk the garden every day  
learn from a natural farmer the laws of  
nature as they emerge through practice  
into common sense  
you learn to express by association with  
natural beings within systems of flow  
you practice community until cohesion is  
served on a plate  
a local meal surrounded by friends  
you will understand disruption of  
seasons  
cycles and history  
of culture family and neighbors  
of wild places cultivated places and  
everything in between  
you will sense and begin to puzzle forth  
a quilt of succession  
you will hear touch and see the microbes  
insects and animals who have found this  
garden a place of sanctuary  
without disruption  
if you're not in a garden you may listen  
to the teachings of the garden  
model the garden visit the garden for  
immersions  
you may listen and let go of assumptions  
fear and hatred  
you may be nourished inspired triggered  
and calmed  
you may gift  
be gifted and learn to receive  
you desire a garden of your own  
you are given repeatable evolving  
templates  
by which to enter your garden gate  
without disruption  
there is tragedy of the commons  
most of us don't know what legacy  
gardens are  
we've not been in many in our lives  
because they are rare  
they require our attention and  
experience to truly reveal themselves  
if we don't know what a garden is  
then we don't know the function of a  
garden either  
it's been a conundrum for me my quest to  
save this particular garden for over a  
year to describe the garden by its  
functions as a new model of value

and to have its potential fully  
understood  
functions are understood in terms of  
where our food comes from and best  
practices through diversity regeneration  
and natural systems or laws  
we all agree with this think we know  
what it means  
what i've tasked myself with is to  
translate these practices  
through the function of an actual  
regenerative garden  
into a language that money understands  
why money  
because money pays the banks who own the  
garden and if these regen functions we  
so highly value  
and not our heads at are not of the  
money-making kind then they are not  
useful within the system of ownership  
yet the functions that arise  
from a high-functioning regenerative  
system require relationships that are  
agreement fields  
acknowledging place  
time and condition  
systems that arise from a regenerative  
garden may make money but the healthy  
sort of contracts are ironically of a  
non-fungible nature  
there is no transaction that can occur  
that is ever the same again  
this is because regenerative value is  
defined within the ecosystems that are  
supported  
so are seasonally dependent and  
reflective of cultural coherence  
ever changing  
what is needed most as we evolve from  
systems  
um  
in every way from how we communicate to  
how we structure and define work play  
and fair share are living models of  
regenerative systems  
models that are cohesive within local  
communities  
networked within larger ecosystems and  
familiar with emergent web 3  
technologies as well as what works  
towards building soil restoring degraded

ecologies and growing and curating food  
grown locally  
needed too is data collection that is at  
the same time simple to apply and  
repeatable yet flexibly adaptive and  
attentive to feedback loops  
small matters  
this is best done with small scale  
adaptions to gain the knowledge and  
experience before larger systems  
iterations  
in natural farming there's a saying  
a gardener walks her field every day  
this is simply because every day is so  
different from the last  
and as succession is recognized as the  
truest most radical movement we could  
participate in we will need eyes and  
hearts open to the messages and lessons  
we will rejoice in  
lala gardens is a one acre demonstration  
and showcase garden for permaculture  
design  
natural farming which is an indigenous  
technology an ancient eastern tech  
elegantly effective in restoring  
microbial diversity  
in restoration and cultivation  
can be practiced any place any time and  
under any condition  
utilizing what is around you without  
externalities  
this means anyone can do it this means  
it is repeatable in any environment  
truly revolutionary  
lala gardens is also poised within the  
ecosystem of web3 to be a demonstration  
of technologies as a use case in  
refining patterns of care and  
effectiveness in an intimate creative  
environment  
lala gardens creates templates and  
modules of regenerative lifestyle  
including animal husbandry and small  
holdings in rural and urban settings  
there is immersion here education and  
on-site participation  
as well as on the ground community  
network of support  
perhaps there will be a go walk dao  
meeting to discuss the allotment of milk

and cheese  
by virtue of existing gardens everywhere  
by networks rooted in the soil i'm here  
to announce there is a pathway  
there are agreements  
thank you
