Subject: FW: Sovereign / E&Y / Chatham Hedging conference call this afternoon

Amanda,

As we discussed, we thought the attached analysis would be helpful for our conference call this afternoon. This analysis shows that Sovereign's brokered CD hedges only experience failing effectiveness ratios (outside of the 80% to 125% range) when the changes in fair value of the hedges involved are very small, and are therefore only attributable to the law of small numbers issue.

The attached spreadsheet contains two tabs - the first tab, titled "Shocks", contains the shock analysis results for each brokered cd hedging relationship for the following interest rate scenarios - the base case and + / - 100, 50, 40, 30, 20, and 10 basis points. The second tab, titled "Chart" contains scatter graphs that plot each computed effectiveness ratio in relation to the size of the corresponding swap fair value change - **the graphs indicate that effectiveness ratios outside of the 80% to 125% range only occur when the swap change in fair value is very small - only when the change is less than 0.25% of the swap's notional amount.**

There are more than 1,500 data points resulting from the shock analysis. Rather than put them all in one chart, we decided to prepare three separate charts with about 500 data points in each. This does not change any of the results, but makes the charts much easier to read. In addition, we excluded 4 data points from the graphs, which had effectiveness ratios of 399% and above and also had corresponding swap changes that were very close to zero. Since these data points further support our position but make the charts very difficult to read, we carved them out and made special note of them in the analysis. Please let me know if you have any questions or would like additional information

Thanks,

Tom Cestare
