An Artificially Intelligent Equity Index

The AI Powered US Equity Indexes are the first and only rules-based equity strategies to use IBM Watson to turn data into investment insight.

By working around the clock to keep up with the increasing volume of data created every day, the AI Powered US Equity Index 5 ("[AiPEX5](#)") uses the power of Artificial Intelligence ("AI") to continually improve processes, in an effort to build an informational advantage as markets evolve and as new information becomes available.

[AiPEX5](#) seeks to identify companies whose stock prices are poised for potential growth through an objective selection process that is like a fundamental approach, only thousands of times faster and broader in scope.

The Future of Investing

For investors seeking to grow their wealth by investing in equities, the birth of Big Data represents an unprecedented opportunity. Each new piece of data represents a new possible insight on a company or the markets that can lead to better investment decisions.

However, the sheer amount of data now available to investors is staggering, and the gap between what is available and what humans can take in and analyze is wide and will only continue to grow.

By some measures, **90%** of the data that exists today has been created in just the past **two years**, and data continues to explode at an **exponential pace**.*

Much of this data is **non-traditional**; newer data such as social media posts, satellite imagery, and website traffic patterns must be **analyzed and organized** to be useful.*

Recent advances in machine learning and cloud computing enable AI systems to analyze and **continuously learn from the vast amount of data** being generated each day.*

Successful investment strategies of the future must keep up with the growing amount of data being generated each day.

* Please see the IBM website for more information. Information contained in IBM's website is not incorporated by reference in, and should not be considered as part of, this brochure.

AI Powered Equity Investing

The AI professionals at EquBot developed AiPEX5 to not only keep up, but also to thrive in an increasingly complex world of data by using AI techniques including Natural Language Processing and Machine Learning.

AiPEX5 is a new kind of equity strategy utilizing IBM Watson's Artificial Intelligence. Watson enables AiPEX5 to understand the equity markets and to read and analyze millions of traditional (e.g. financial statements) and non-traditional (e.g. news articles) data sources each day. With Watson, AiPEX5 is able to build intuition, experience, and to continuously learn as headlines break and new information becomes available.

Applying what it has learned, AiPEX5 objectively evaluates and scores each of the 1,000 largest U.S. publicly traded companies in order to find those whose stock prices are poised for growth and rebalances its portfolio monthly by following a 3-step equity selection process.

AiPEX5 can identify and quantify relationships that are not readily apparent to humans. Rather than one analyst's opinion, AiPEX5 selects stocks based on the insights uncovered by an entire army of simulated research analysts and traders who are in complete coordination, allowing for information learned by one to be instantly known by all.

AiPEX5 3-Step Monthly Equity Selection Process:

1. Score

Scores for the 1,000 largest U.S. companies are calculated based on:

- **Financial Health Score:** evaluates a company's fundamentals and key figures.
- **Management Score:** assesses a company's management strength and thought leadership.
- **News & Information Score:** measures a company's market sentiment, economic, and geopolitical risks.

2. Select

Approximately 250 companies with the highest combined Financial Health, Management, and News and Information Scores are selected for the portfolio.

3. Diversify

Companies are assigned portfolio weights, with the largest weights going to the companies with the highest combined scores (subject to diversification and market liquidity limits).

Daily Risk Control Helps Provide Smoother Returns

AiPEX5

AiPEX5 reacts daily to changing market conditions, as rapid movement in the market, or volatility, can create greater potential risk.

AiPEX5 reduces the impact of short-term volatility in the equity markets through daily re-allocations between the equities selected by the AI algorithms and a cash component.

AiPEX5 seeks a 5% daily volatility target. If the volatility falls below the target, the allocation to selected equities is increased up to a maximum of 150%. If the volatility is greater than the target, allocations to the selected equities may be reduced. Allocations below 100% to selected companies will be reallocated to a cash component.

AiPEX5 Performance: Historical & Simulated

The AI Powered US Equity Index 5 would have provided growth through a variety of market environments due in part to a monthly equity selection process intended to adapt to market changes and mitigate potential risks. While real-time calculations did not begin until May 4, 2020, the graph below illustrates how AiPEX5 would have provided long-term positive returns with low volatility.

Key Statistics and Characteristics

Index returns as of 3/31/2021	AI Powered US Equity Index 5 (ER)	S&P 500 Daily Risk Control 5% Index (ER)
1 Y	7.39%	7.74%
3 Y	6.71%	9.32%
5 Y	26.74%	28.13%
10 Y	54.11%	46.83%
10 Y Volatility	4.86%	5.02%

Bloomberg Ticker	AiPEX5
Asset Class	Equity
Geographical Focus	United States
Launch Date	May 4, 2020
Type of Return	Excess Return
Index Sponsor	EquiBot, Inc.
Calculation Agent	Solactive AG
Adjustment Factor ¹	0.85% per year

¹ AiPEX5 Index values shown here, and as calculated and published by Solactive AG, are net of the 0.85% p.a. Adjustment Factor (deducted daily). The graph and table above sets forth the hypothetical back-tested performance of the Index from March 31, 2011 through May 4, 2020 and actual index performance thereafter through March 31, 2021. See the risk factors and "Use of Simulated Returns" herein.

Growing Presence of Artificial Intelligence

The AiPEX indexes are the first of their kind, but likely not the first time investors have encountered AI. Technology similar to that which AiPEX5 uses to gain market insights is already helping to improve our daily lives, even if we don't realize it.

AI is helping the Mayo Clinic improve their breast cancer early screening results and match patients with clinical trials.*

AI is helping our armed forces and law enforcement professionals identify persons of interest with facial recognition.*

AI is helping power the billions of online searches each day, and has transformed the communication industry with software such as text message auto completion.*

Index Collaborators

IBM Watson is IBM's suite of enterprise Artificial Intelligence applications and APIs. IBM Watson represents a new era in computing, where systems understand the world the way humans do: through intuition, learning, and experience. IBM Watson continuously learns, gaining value and knowledge from interactions over time.

EquBot, Inc. ("EquBot"), a San Francisco based asset manager, is a member of the **IBM Global Entrepreneur Program** and developed AiPEX5 to provide investors access to the opportunities that AI can uncover. EquBot was co-founded by the former Director of Engineering at Intel, was the first manager to develop an AI based ETF, and currently manages several funds and separate accounts for institutional investors.

HSBC is one of the world's largest banking and financial services companies, an award winning provider of US Structured Products, and is the exclusive licensor of the AiPEX suite of indexes.

Key Terms and Definitions

Artificial Intelligence

enables computers to do things normally requiring human intelligence, such as visual perception, speech recognition, interpretation of language, and decision-making

Natural Language Processing

is a branch of artificial intelligence that reads, deciphers, understands, and makes sense of human languages

Machine Learning

is a subset of artificial intelligence that gives computers the ability to learn without being explicitly programmed in order to identify patterns and make successful predictions

Volatility

is the range of price change a security experiences over a given period of time. If the price remains relatively stable, the security has low volatility and if the price moves erratically, the security has high volatility

Risks Associated with the AI Powered US Equity Index 5 (USD) Excess Return (“AiPEX5”)

The strategy tracked by AiPEX5 and the Base Index and the views implicit in AiPEX5 and the Base Index are not guaranteed to succeed.

The strategies tracked by AiPEX5 and its underlying index, the AI Powered US Equity Base Index (the “Base Index”), are not guaranteed to be successful. It is impossible to predict whether and the extent to which AiPEX5, the Base Index or the underlying constituents of the Base Index will yield positive or negative results. AiPEX5 adjusts its exposure to the Base Index based on historical economic relationships which may not hold true in the future. You should seek your own advice as necessary to assess AiPEX5, the Base Index and their respective strategies.

AiPEX5 and the Base Index were recently launched and have limited operating history.

AiPEX5 was launched on May 4, 2020 and therefore has limited historical performance. The Base Index has also recently launched and has similarly limited historical performance. As a result, limited actual historical performance information is available for you to consider in making an independent investigation of AiPEX5, which may make it more difficult for you to evaluate the historical performance of AiPEX5 and make an informed investment decision than would be the case if AiPEX5 and the Base Index had a longer trading history.

Hypothetical back-tested performance prior to the launch of AiPEX5 and the Base Index provided in this brochure refers to simulated performance data created by applying AiPEX5’s and the Base Index’s calculation methodologies to historical prices of the equities that comprise the Base Index and SOFR or, prior to April 2, 2018, the Federal Funds Rate (as described in the AiPEX5 index guideline available on Solactive AG’s website). Such simulated performance data has been produced by the retroactive application of a back-tested methodology in hindsight, and may give more preference towards equities that have performed well in the past. Hypothetical back-tested results are neither an indicator nor a guarantor of future results.

The hypothetical back-tested performance of AiPEX5 prior to May 4, 2020 cannot fully reflect the actual results that would have occurred had AiPEX5 actually been calculated during that period, and should not be relied upon as an indication of AiPEX5’s future performance. A longer history of actual performance could be helpful in providing more reliable information on which to assess AiPEX5.

AiPEX5 may not approximate the Target Volatility.

No assurance can be given that AiPEX5 will maintain a realized volatility that approximates the Target Volatility, and the actual realized volatility of AiPEX5 may be greater or less than the Target Volatility. AiPEX5 seeks to maintain a realized volatility approximately equal to the Target Volatility of 5% by rebalancing its exposures to the Base Index on each day based on two measures of realized volatility. However, there is no guarantee that trends exhibited by any such measures will continue in the future.

The volatility-targeting feature may cause AiPEX5 to perform poorly during certain market conditions.

AiPEX5 allocates exposure to the Base Index based on two measures of realized volatility. Realized volatility is not the same as implied volatility, which is an estimation of future volatility, and may better reflect market volatility expectation. Because exposure is adjusted based on historic levels and trends, AiPEX5 may not meaningfully reduce its exposure to the Base Index until a down-turn has already occurred, and by the time reduced exposure does take effect, the recovery may have already begun.

AiPEX5 varies its exposure to the Base Index. As a result, exposure to the Base Index may be limited and the performance of AiPEX5 may be adversely affected.

AiPEX5, on each day on which it is calculated, adjusts its exposure to the Base Index in an attempt to maintain a historical volatility approximately equal to the Target Volatility. If the exposure to the Base Index is less than 100%, AiPEX5 will include an uninvested position that does not earn interest or any other return. AiPEX5 may include an uninvested position even when the Base Index is performing favorably. As a result, AiPEX5 may underperform a similar index that does not include an uninvested position.

The performance of AiPEX5 will be reduced by the performance of the reference rate and the embedded adjustment factor.

AiPEX5 is an excess return index. The return of AiPEX5 is determined by reference to the performance of the Base Index (as adjusted based on the applicable exposure) in excess of the performance of a reference rate, SOFR. The level of AiPEX5 also reflects an embedded adjustment factor of 0.85% per annum, deducted daily. The performance of the reference rate and the embedded adjustment factor will offset, in whole or in part, any positive performance and increase any negative performance of the Base Index. As a result, any return on AiPEX5 may be reduced or eliminated. When AiPEX5 is uninvested (i.e. the exposure to the Base Index is less than 100%), the negative effect of the embedded adjustment factor will be magnified, and the return on AiPEX5 may be negative even while the level of the Base Index increases.

Any changes to SOFR may adversely affect the level of AiPEX5.

A discontinuance of SOFR or a change in its method of calculation could have a material adverse effect on the level of AiPEX5.

SOFR has a very limited history, and its historical performance is not indicative of future performance.

The Federal Reserve Bank of New York began to publish SOFR in April 2018. Although the Federal Reserve Bank of New York has also begun publishing historical indicative SOFR going back to 2014, such historical indicative data inherently involves assumptions, estimates and approximations. Therefore, SOFR has limited performance history, and any hypothetical back-tested performance of AiPEX5 prior to April 2, 2018 was calculated using the Federal Funds Rate plus a spread in place of SOFR.

Future levels of SOFR may bear little or no relation to the historical level of SOFR. The future performance of SOFR is impossible to predict and therefore no future performance of SOFR may be inferred from any hypothetical or actual historical performance data. Hypothetical or actual historical performance data are not indicative of the future performance of SOFR.

The Base Index selects and weights its underlying constituents based on AI models; the strategies and views implicit in such models and in the Base Index are not guaranteed to succeed.

The strategy of the AI models, and therefore the Base Index, is not guaranteed to be successful. It is impossible to predict whether and the extent to which any underlying constituents of the Base Index will yield positive or negative results.

The method by which the Base Index reweights the underlying constituents and the reallocation period may negatively affect the level of the Base Index.

The underlying constituents are reviewed and the Base Index is rebalanced monthly. At the end of each month, the AI models are used to recalculate the AI scores for each eligible constituent, and these scores are used by the index sponsor to select and weight the underlying constituents, subject to pre-determined constraints. The weight of each underlying constituent selected from the eligible constituents is subject to a cap (equal to 7.50% unless a lower cap is applicable based on the liquidity of such underlying) and any excess weight is allocated to the iShares® 1-3 Year Treasury Bond ETF (“the ETF Constituent”). The allocation rules, including the cap, will be followed even where they limit the Base Index’s exposure to positively performing underlying constituents or increase the Base Index’s exposure to negatively performing underlying constituents, and may result in lower returns on the Base Index.

The Base Index is exposed to equity risk, including from mid-capitalization companies.

The Base Index is linked to the performance of the underlying constituents, which include U.S. large-capitalization and mid-capitalization stocks. The level of the Base Index can rise or fall sharply due to factors specific to the underlying constituents, such as stock price volatility, earnings and financial conditions, corporate, industry and regulatory developments, management changes and decisions and other events, as well as general market factors, such as general market volatility and levels, interest rates and economic and political conditions.

Changes in U.S. Treasury rates and the perceived creditworthiness of the United States may affect the level of the Base Index.

Because the value of the Base Index is linked, in part, to the ETF Constituent which tracks the value of U.S. Treasury bonds, changes in U.S. Treasury rates may affect the level of the Base Index.

AiPEX5 and the Base Index are purely notional.

The exposures to the underlying constituents are purely notional and will exist solely in the records maintained by or on behalf of Solactive AG. There is no actual portfolio of assets to which any person is entitled or in which any person has any ownership interest. Consequently, you will not have any claim against any of the underlying assets that are referenced by AiPEX5 or the Base Index.

Solactive AG administers, calculates and publishes AiPEX5 and the Base Index.

Solactive AG has the authority to determine whether certain events affecting AiPEX5 or the Base Index have occurred including, but not limited to, events affecting the reference rate or the underlying equity constituents of the Base Index.

Potential investors in any financial instrument of which AiPEX5 or the Base Index is an underlying need to be aware that any determination or calculation made by Solactive may affect the level of AiPEX5 or the Base Index, as applicable, and, as appropriate, the performance of any instruments linked to the performance of AiPEX5 or the Base Index. Solactive AG has no obligation to consider the interest of investors in any such instruments when making any determination or calculation. Such discretion in the decisions taken by Solactive AG (in the absence of manifest or proven error) are binding on all investors and holders of such instruments.

The level of the Base Index, and therefore AiPEX5, may be determined by reference to the SPDR® S&P 500® ETF (“SPY”) if the AI models become unavailable.

In the event that EquBot Inc., the provider of the AI models, no longer provides the applicable AI scores with respect to the eligible constituents, the shares of SPY will be selected as the sole underlying constituent of the Base Index with a weight of 100%. In such an event, the value of the Base Index, and therefore AiPEX5, will be determined by reference to SPY.

entity from the use of the Index. Solactive AG does not guarantee the accuracy and/or the completeness of the Index and shall not have any liability for any errors or omissions with respect thereto. Solactive AG reserves the right to change the methods of calculation or publication and Solactive AG shall not be liable for any miscalculation of or any incorrect, delayed or interrupted publication with respect to the Index. Solactive AG shall not be liable for any damages, including, without limitation, any loss of profits or business, or any special, incidental, punitive, indirect or consequential damages suffered or incurred as a result of the use (or inability to use) of the Index.

Use of Simulated Returns

The Index was launched on May 4, 2020 and therefore has limited historical performance. The Base Index has also recently launched and has similarly limited historical performance. As a result, limited actual historical performance information is available for you to consider in making an independent investigation of the Index, which may make it difficult for you to evaluate the historical performance of the Index and make an informed investment decision than would be the case if the Index and the Base Index had a longer trading history.

Hypothetical back-tested performance prior to the launch of the Index and the Base Index provided in this brochure refers to simulated performance data created by applying the Index and the Base Index's calculation methodologies to historical prices of the underlying constituents and the reference rate. Such simulated performance data has been produced by the retroactive application of a back-tested methodology in hindsight, and may give more preference towards underlying constituents that have performed well in the past. Hypothetical back-tested results are neither an indicator nor a guarantor of future results.

The hypothetical back-tested performance of the Index prior to May 4, 2020 cannot fully reflect the actual results that would have occurred had the Index actually been calculated during that period, and should not be relied upon as an indication of the Index's future performance. Because of the lack of actual historical performance data, your investment in any structured investment linked to the Index may involve a greater risk than investing in a security or other instrument linked to one or more indices with an established record of performance.
