Hypothetical Payout Profile**

**assumes a call premium equal to the lowest possible call premium that will be determined on the pricing date.

If the securities are automatically called, the positive return on the securities will be limited to the call premium, and you will not participate in any appreciation of the Index beyond the call premium, which may be significant. If the securities are automatically called, you will no longer have the opportunity to participate in any appreciation of the Index at the upside participation rate.

If the securities are not automatically called and the ending level is less than the threshold level, you will have full downside exposure to the decrease in the level of the Index from the starting level, and you will lose more than 25%, and possibly all, of the face amount of your securities at maturity.

The estimated initial value of the securities on the pricing date is expected to be between \$916.50 and \$966.50 per security, which will be less than the original offering price. The market value of the securities at any time will reflect many factors and cannot be predicted with accuracy. See "Terms of the Securities—Estimated Initial Value" in the accompanying free writing prospectus.
