## NEWS RELEASE

July 25, 2003

TSX Trading Symbol: FNC  
S.E.C. Exemption: 12(g)3-2(b)

The Company wishes to report preliminary results from two (vertical) holes drilled to date in the current program on the Mingan Titanium Option.

Hole #5, located 45 metres east of the previously reported Hole #4, returned two massive hemoilmenite sections; 4.6 metres, between 11.6 and 16.2 metres, and 10.7 metres, between 37.2 and 47.9 metres in the hole. The host rock is anorthosite, and the hole finished at 51.8 metres.

Hole #6, located 45 metres SW of Hole #4, returned 3 metres of massive hemoilmenite between 18.9 and 21.9 metres in the hole. The host rock is anorthosite, and the hole finished at 43.6 metres.

Hole #6 lies on the edge of the gravity high; all other holes drilled to date lie well within it – further indication that the high is indeed related to the presence of dense massive hemoilmenite close to the surface.

Prospecting, which is ongoing, has revealed previously unseen massive hemoilmenite at surface 50 metres east of Hole #3; its extent is presently unknown, but it will be drilled along with other targets in the current program.

### **ON BEHALF OF THE BOARD**

“Peter H. Smith”, Ph.D., P.Eng., President
