Winter Program Successfully Completed, North James River Project, Nunavut

Donald R. Sheldon, President of Pure Gold Minerals Inc. (the "Corporation"), is pleased to announce that the planned Electromagnetic ("EM") geophysical surveys on the North James River Property, Nunavut ("the Property") have been completed. The Property is located immediately to the west and to the north of the High Lake massive sulphide deposits of Wolfden Resources Inc. ("Wolfden") who has also recently commenced winter field operations.

A series of surveys were completed over EM and magnetic anomalies defined by the airborne Electromagnetic (EM) and Magnetic survey completed by Fugro Airborne Surveys Corp. over selected areas of the claim block in the fall of 2003. Each of the targets was selected as a result of detailed processing and the subsequent interpretation of the airborne data by the Company's consultant geophysicists. SJV Geophysics of Delta, British Columbia, conducted the ground surveys, which consisted of UTEM electromagnetic and a magnetic survey. The results from the survey will now be processed and interpreted in relationship to the data from the airborne survey and previous exploration results. Anomalies were evaluated on all three blocks flown during the Fall survey, including two anomalies associated with the Hi Lake Zn-Cu showing discovered by Noranda Exploration Inc. ("Noranda") in 1976 and one anomaly just 5 kilometers to the east of Wolfden's High Lake Deposits. This Hi Lake discovery was interpreted by Noranda to be a copper-zinc bearing feeder system associated with a volcanoclastic massive sulphide environment, such as that which hosts the High Lake deposits.

The Company and its Joint Venture Partner, Bard Ventures Ltd. are now planning for the upcoming 2004 summer field season. Priority targets will be the EM anomalies defined by the airborne and ground surveys and the Silver Bullet and Black Ice gold zones. Gold mineralization was reported by BHP Minerals Canada Ltd. in 1993 and 1994. Gold occurs along a 3-kilometer shear structure in felsic volcanics. The Silver Bullet and Black Ice zones returned high-grade gold values up to 154-g/t gold and 21-g/t gold respectively with widths up to 2 meters. The Silver Bullet zone has been traced along a strike length of 230 meters and the Black Ice zone along a strike length of 120 meters. The summer program consisting of geological mapping, prospecting, sampling and drilling will be commenced as soon as ground and weather conditions permit.
