### Manson Creek Provides Uranium Exploration Update

Manson Creek Resources Ltd. ('Manson Creek') is pleased to provide an exploration update for the Black Lake Uranium project, located in northern Saskatchewan.

Manson Creek recently completed a geological mapping, prospecting and sampling program in conjunction with detailed ground based radiometric surveys. This program outlined two significant target areas on mineral claims held in the Charlebois and Black Lakes areas. The Company will undertake a 2,000 meter diamond-drilling program, scheduled to begin in mid July, to assess these radiometric anomalies.

At Charlebois Lake a significant radiometric anomaly has been identified over a strike length in excess of two kilometers. The anomaly is comprised of zones of radioactive pegmatite outcropping at surface which range in apparent width from one meter to over 40 meters.

Within the A Zone, located near Black Lake, a 200 meter by 250 meter zone has been mapped radiometrically and at surface. The A Zone, the focus of historical exploration programs, contains significant volumes of radioactive pegmatite within the host granitoid suite.

A total of 47 grab and continuous chip samples were collected during the prospecting and sampling program. Samples were collected from historical and new showings located throughout the properties. These samples have been submitted to SRC Analytical Laboratories of Saskatoon and results are expected shortly.

#### **Corporate**

Manson Creek wishes to cordially invite you to join Regan Chernish, President and CEO at the 2007 World Gold, PGM & Diamond Investment Conference – Booth 416 to learn more about Manson Creek. During this event Manson Creek invites all brokers, fund managers and investment clubs to take this opportunity to meet with us to discuss our upcoming activities.
