Re: Proposed Amendments to Exchange Act Rule 3b-16 (Release No. 34-94062; File Number S7-02-22)

Dear Ms. Countryman,

I am writing as a user of decentralized finance systems to express my concerns with the SEC's proposed amendments to Regulation ATS issued on January 26, 2022 (the "Proposal"). The Proposal includes a revised and vastly expanded definition of "exchange" which could dramatically expand the SEC's authority to regulate technologists who "make available" peer-to-peer "communication protocols" used in decentralized finance. These technologists and the system they create are not and cannot feasibly become regulated securities intermediaries or alternative trading systems ("ATs"), and thus the proposed amendments could, if interpreted in an expansive way, amount to a back-door prohibition of a vast swathe of actual and potential peer-to-peer finance protocols.

Background:

I am a green rabbit on Twitter. In the real world, I have 8 years of experience as a corporate restructuring and insolvency lawyer and work full-time on law reform in respect of digital assets. In my work I have found that it is often appropriate and useful to draw analogies between decentralised financial systems and centralised financial systems. However, I have also found that it is equally important to acknowledge the differences between decentralised finance and centralised finance. Doing so allows for a more flexible, nuanced and technology-specific (as opposed to technology-neutral) approach, which I think will ultimately lead to better results.

One of my principal concerns with the Proposal is therefore that decentralised systems could be brought within a regime that is poorly-suited to acknowledge the idiosyncrasies of decentralised finance. Moreover, if it is the purpose of the Proposal to bring decentralised finance within scope, I think that this should be made explicit and clear instead of attempting to achieve that purpose through an exercise of definitional gerrymandering. Finally, I think that consultation and engagement with market and industry participants is crucial when considering regulatory or legal change. Unfortunately, the short response period for the Proposal reduces the opportunities for this kind of helpful engagement.

Overview of peer-to-peer communications protocols:

Peer-to-peer communication protocols may include automatic-market-making "smart contracts" ("AMMs") which are permissionlessly accessible on Ethereum and other decentralized blockchain systems. These "smart contracts" are simply machine-readable code that is stored on a distributed ledger and will be executed by miners or validators (on an anonymous, decentralized basis) for users who pay fees as part of cryptographically signed transaction messages (on an anonymous, decentralized basis). Once written and deployed to a blockchain, no person controls or can limit access to such smart contracts. Even the miners—who are necessary to run the smart contract code—do not individually have the power to limit access to these smart contracts nor surveil the users of these smart contracts. Unlike a broker/dealer or other securities intermediary, neither the code developers nor the miners have a contractual or fiduciary relationship with the users. A redesign of the system which requires an off-chain relationship between

miners/validators, on the one hand, and users, on the other hand, would defeat the entire purpose of this technology by requiring users to have trust in and expose their personal data to the miners/validators. When Congress intended in creating the Securities Exchange Act of 1934, it cannot have intended to mandate intermediation or to prohibit people from transacting in digital assets on a peer-to-peer basis using new technologies. I acknowledge that there are many intermediaries within decentralised finance, and much of the market infrastructure has replicated the existing intermediated securities infrastructure – particularly where centralised custodians are involved. However, this does not mean that decentralised finance doesn't retain elements of true decentralisation. Nor does it mean that existing approaches to intermediation can be wholly applied to idiosyncratic and truly decentralised systems.

Peer-to-peer communications protocols encompassed in the Proposal:

In AMMs, users may indicate their “non-firm trading interest” in selling certain digital assets by depositing digital assets into a smart contract (i.e., cryptographically signing a transaction whereby the smart contract code will release the tokens to new users if specified conditions are met). This facilitates trustless, disintermediated trading of digital assets and ensures that users are not trapped in illiquid positions in their digital asset holdings. When the relevant conditions are satisfied (usually a user on the buy-side sending a transaction message plus a digital asset purchase amount), a trade is automatically executed. Thus, an AMM may resemble “a system that electronically displays continuous firm or non-firm trading interest....to sell or buy [a digital asset]...[which] can....be executed immediately¹.”

Since the SEC also maintains that certain digital assets are securities², this means that persons who “make available” AMMs or interfaces for utilizing AMMs may now be required by the SEC to register those AMMs as ATSs or securities exchanges. This may include:

- individuals and private entities who write and publish smart contract code as a hobby or business, who may have no training in the securities industry, may not work for a broker-dealer and may not otherwise be subject to the jurisdiction of the United States;
- individuals and private entities who run “miners” or “validators” on the underlying blockchain where the AMM is stored (i.e., persons who have configured computers to automatically perform mining and validation services on the network, with minimal human oversight);
- persons who provide liquidity to such AMMs (since the AMM cannot operate without their participation);
- persons who run websites which facilitate use of AMMs;—including academic “block explorers” with smart contract interaction functionality
- persons who write “blockchain client software” which is run by independent miners/validators and enables general mining, validation and transacting on the blockchain network.

None of these persons are securities professionals or intermediaries as currently understood. Furthermore, they would be unable to comply with existing regulations—such as obtaining and maintaining records about the legal identities of “subscribers”—applicable to securities exchanges and ATSs as the systems themselves are pseudonymous by virtue of their cryptographic security. These systems are designed to give users a way to exchange digital assets without hiring a broker/dealer or placing their assets into another person's custody—thus, these systems are also designed to avoid any persons having powers similar to a broker/dealer or exchange operator.

¹ [The Proposal](#), page 20; [Statement on Government Securities Alternative Trading Systems](#).

² [Committee on Banking, Housing, and Urban Affairs Oversight of the US Securities and Exchange Commission September 14, 2021](#), page 9.

Accordingly, regulating these systems as “exchanges” would be tantamount to banning them in their current form. Although the SEC has broad authority, it does not have authority to determine which technologies are legal or illegal to “make available.” But such would be a potential perverse effect of this amendment.

I urge you to reconsider the over-broad provisions in the Proposal. This sweeping expansion to the definition of “exchange” to apply to any communication protocol system (not limited to just autonomous cryptosystems or block explorers) is an impediment to innovation; it could ultimately force builders and users of decentralized finance systems to leave the United States or devote their skills and effort to companies and technologies being built outside of the United States—a nation-wide “brain drain” of cutting-edge technologists from which the United States might never recover.

Thank you for your consideration.

Kind regards

Gonbe
