

MEMORANDUM

TO: File No. S7-14-11

FROM: Arthur Sandel
Special Counsel
Office of Structured Finance
Division of Corporation Finance
U.S. Securities and Exchange Commission

RE: Conference call with SFIG representatives

DATE: January 29, 2014

On January 17, 2014, Arthur Sandel, David Beaning and Lulu Cheng of the Division of Corporation Finance and Sean Wilkoff and Igor Kozhanov of the Division of Economic and Risk Analysis participated in a conference call with the following representatives of the Structured Finance Industry Group, Inc. (“SFIG”): Sairah Burki of SFIG; Mike Mitchell of Chapman and Cutler LLP; Julie Gillespie of Mayer Brown LLP; Eve Ngan of JPMorgan Chase; Scott McCarthy of Bank of America; Keith Helwig of RBC Capital Markets; and Sam Smith of Ford Motor Company.

The following staff of other federal regulators also participated: James Basham of the OCC; Kathy Russo, Phil Sloan, Gene Pocase, Steve Lake, William Haston, Robert Hendricks, Jacob Doyle, Suzanne Clair and Rohit Dhruv of the FDIC; April Snyder and Donald Gabbai of the Federal Reserve Board; and Beth Mlynarczyk and Ankur Datta of the Department of the Treasury.

The participants discussed topics related to the Commission’s August 28, 2013 joint proposed rules regarding credit risk retention. Handouts are attached to this memo.

**APPLICATION OF CREDIT RISK RETENTION RULE
TO REVOLVING MASTER TRUSTS**

JANUARY 17, 2014

AGENDA

- 1. Recap of Key Points from 12/16/13 Meeting – Modest Changes to Make the Rule Significantly More Workable for Major Segments of the Master Trust Market**
(Slides 3-6 from our 12/16/13 slide desk)

- 2. Seller's Interest Form of Risk Retention: Treatment of Subordinated Seller's Interests**
(Annex A to this Agenda)
 - The seller's interest in virtually every master trust features some form of subordination to the investor interests.
 - Each such form should be recognized as an available form of risk retention under the final rule.
 - If the joint regulators seek to treat different forms of subordination differently, the distinction should be based on the characteristics of the seller's interest taken as a whole. Credit subordination should not be the sole determinant. See Annex A to this Agenda.

- 3. Horizontal Risk Retention Options for Revolving Master Trusts**
(Slides 8-10 from our 12/16/13 slide deck)
 - Many forms of horizontal risk retention commonly used in current master trust structures cannot satisfy the standard or the special horizontal risk retention option as proposed.
 - If one or more forms of subordinated seller's interest are treated like horizontal residual interests under the rule, this problem will be exacerbated because subordinated seller's interests are no better suited to satisfy these proposed horizontal risk retention options.
 - It is critical, therefore, that the special horizontal risk retention option for master trusts be revised as set forth in SFIG's comment letter to accommodate the additional forms of horizontal risk retention already used in the market, as well as any form of subordinated seller's interests that is treated like a horizontal residual interest under the rule.

4. Valuation of, and Measurement Dates for, Subordinated Seller's Interests and Horizontal Interests in Master Trusts

(Slides 12-14 from our 12/16/13 slide deck)

- A fair-value determination for subordinated seller's interests and horizontal interests in master trusts would be burdensome, especially if sponsors are required to perform such calculations monthly or to re-value previously-issued ABS interests on the closing date for each new issuance.
- We believe that a face-value measurement would better balance the competing considerations in the context of master trusts, so long as the master trust does not monetize excess spread.¹
- If our request to measure subordinated seller's interests and horizontal interests on a face-value basis is not adopted, and if the Joint Regulators determine that a re-valuation of such interests is required, either monthly or on each new issuance date, we request that the alternative valuation method outlined in our comment letter – using the “invested amount” of the related ABS interest – be adopted.

¹ As noted on slide 13 of our 12/16/13 slide deck, we believe a fair-value measurement would be appropriate in the case of a residual interest in series-level excess spread. However, given the complexity of valuing excess spread, we believe most sponsors will elect not to claim credit for such interests. We believe, therefore, that the final rule should allow sponsors to disregard their residual interest in excess spread and still receive credit for other horizontal interests that it retains.

Forms of Seller's Interests

- ***Pari Passu Seller's Interest:*** Virtually all master trusts allocate principal collections between the investor interests and the seller's interest on a *pari passu* basis only during revolving periods, and on a fixed allocation basis during other periods, including scheduled principal accumulation or scheduled principal amortization periods. This fixing of allocations of collections to the investor interests operates as a form of subordination of the seller's interest.
- ***Pari Passu Seller's Interest with Subordination of Collections:*** In some master trust transactions, collections that are allocated to this *pari passu* seller's interest may first be applied to cover shortfalls, if any, remaining after application of collections allocable to the investor interests.²
- ***Seller's Interest Comprised of Two Parts: A *Pari Passu* Seller's Interest and a Series-Level Subordinated Seller's Interest:*** In some other cases — a typical floorplan securitization, for example — the seller's interest is comprised of two parts:
 - (i) one part is a typical *pari passu* seller's interest, and
 - (ii) the other part is a series-level subordinated seller's interest, which is issued in an amount equal to the available subordinated amount for a series and functions as credit enhancement for that series by absorbing losses allocated to the related investor interests before the investor interests are themselves affected (see slide A-7 in our 12/16/13 slide deck).
- In all three cases outlined above, the *pari passu* seller's interest adjusts for fluctuations in the outstanding principal balance of the trust assets, while the series-level subordinated seller's interest generally does not.³ Notably then, the *pari passu* seller's interest acts as a cushion by absorbing seasonal fluctuations in the portfolio and dilutions (returns). By the terms of the seller's interest, therefore, the seller is obligated to fund any and all amounts of principal receivables that arise in the trust accounts from day to day in excess of the aggregate investors interests.
- This obligation to absorb seasonal and other fluctuations in the principal balance of the portfolio represents a fundamental difference from any form of horizontal interest in the trust and, regardless of any subordination of collections, the seller's obligation to fund such amounts operates itself as a significant mechanism to align the interests of the securitizer with those of investors.

² Collections allocable to the seller's interest may be made available to cover shortfalls in interest, principal or both, or to cover loss amounts allocated to investor interests.

³ The series-level subordinated seller's interest is typically issued in a fixed amount but the amount may adjust for the limited purpose of covering the amount of excess concentration receivables arising in the trust accounts from time to time.

- It is true that, in all three cases outlined above, losses allocated to, or absorbed by, the *pari passu* seller's interest reduce the amount of the seller's interest. Notably, however, in virtually every case, once the seller's interest falls below a required minimum level, the seller is required by the governing program documents to transfer receivables arising in additional accounts to the master trust, thereby replenishing the trust assets and, in turn, the seller's interest.⁴
- This obligation to replenish the trust assets and, in turn, the seller's interest represents once again a fundamental difference from the forms of horizontal risk retention envisioned under the proposed rule, and the seller's obligation to transfer receivables arising in additional accounts operates as yet another significant mechanism that aligns the interests of the securitizer with those of investors.
- We request, therefore, that the definition of seller's interest be revised to provide that the seller's interest be *pari passu* with or subordinated to each series of investor interests with respect to the allocation of collections and losses.⁵

⁴ By contrast, losses absorbed by a series-level subordinated seller's interest reduce the amount of such seller's interest but the seller has no corresponding obligation to add new receivables to the master trust or otherwise replenish such seller's interest.

⁵ If this request is not implemented in the final rule, then, as requested on slide 3 in our 12/16/13 slide deck, the definition should instead be revised to require the seller's interest to be *pari passu* with respect to allocations of collections only during revolving periods.

Application of Credit Risk Retention Rule to Revolving Master Trusts

December 16, 2013

Credit Risk Retention and Revolving Master Trusts: Introduction

- We appreciate the changes that the Joint Regulators have made to better align the re-proposed rule with market practice, but more changes are necessary to create workable risk retention options for master trusts.
- Most importantly, as currently proposed, the seller's interest form of risk retention cannot be utilized by any master trust currently in the market.
- In addition, there is a substantial segment of the revolving master trust market – most notably, floorplan securitizations – that do not currently incorporate a *pari passu* seller's interest as a significant structural feature and, therefore, do not expect to utilize the seller's interest option as their primary form of risk retention.
- It is critical, therefore, that (i) the seller's interest option be revised to better align with market practice and (ii) there be a workable horizontal interest option for revolving master trusts.
- Today, we will highlight some of the most important changes that are needed, beginning with certain modest changes to the rule that will make it significantly more workable for major segments of the master trust market.

Modest Changes to Make the Rule Significantly More Workable

1. Seller's Interest Form of Risk Retention: Pari Passu Seller's Interest

The proposed definition of “seller’s interest” contemplates an interest that is *pari passu* to each series of investor interests with respect to the allocation of collections and loss amounts *prior to an early amortization event*.

- In virtually every case, allocations of collections between the investor interests and the seller’s interest are *pari passu* only during revolving periods.
- During other periods, including scheduled principal accumulation or scheduled principal amortization periods, virtually all master trusts fix the allocation of principal collections to the relevant investor interests at the higher levels applicable before principal payments begin.¹
- This fixing of allocations of principal collections to the investor interests provides for the orderly and timely payment of the investor interests, by deferring a full allocation of collections to the seller’s interest when a series, class or tranche of investor interests is in any form of principal accumulation or principal amortization period.
- **Requested Action:** We request, therefore, that any requirement in the final rule that the seller’s interest be *pari passu* to each series of investor interests be modified to require the seller’s interest to be *pari passu* with respect to allocations of collections only during revolving periods.

¹ By comparison, the allocation of losses between the investor interests and the seller’s interest remains pro rata at all times.

2. Seller's Interest Form of Risk Retention: Subordinated Seller's Interest

The Joint Regulators are also considering whether they should make additional provisions for subordinated seller's interests.

- The seller's interest in virtually every master trust features some form of subordination to the investor interests.
- By fixing the allocation of principal collections to the investor interests following a revolving period (as described earlier), the seller's interest becomes subordinated to investor interests.
- In some revolving master trust transactions, collections allocable to the seller's interest may first be used to cover shortfalls, if any, remaining after application of collections allocable to the investor interests, representing a form of credit subordination of the seller's interest to investor interests.
- There are, however, variations in the extent of such subordination, depending on investor preferences and ratings criteria. In some cases, collections allocable to the seller's interest may be made available to cover only shortfalls in interest or principal; in other cases, they may cover shortfalls in both interest and principal; and, in still other cases, they may absorb losses allocated to investor interests.
- Moreover, these forms of subordination are typically limited to collections allocable to the seller's interest in the current distribution period (*i.e.*, prior-period collections distributed to the seller are not available to the investor interests in subsequent periods).

2. Seller's Interest Form of Risk Retention: Subordinated Seller's Interest (cont'd)

- In each of the cases outlined above, these allocation mechanisms provide for the orderly and timely payment of the investor interests, and the seller's interest continues to represent an undivided interest in the securitized receivables that exposes the holder to a proportional or greater share of the credit risk of those receivables as compared with the share borne by the investor interests.
- We believe the seller's interest form of risk retention should give credit for all such forms of subordinated seller's interest on the same basis.
- **Requested Action:** We request, therefore, that the definition of seller's interest be revised to require the seller's interest to be *pari passu* with or subordinated to each series of investor interests with respect to the allocation of collections and losses.²

² If our request to give credit for all forms of subordinated seller's interests on the same basis is not implemented in the final rule, then, as requested earlier, the definition should instead be revised to require the seller's interest to be *pari passu* with respect to allocations of collections only during revolving periods.

3. Special Horizontal Risk Retention Option for Revolving Master Trusts: Reference to “Principal Due”

Clause (3) of the special horizontal interest option for master trusts in § __.5(f) requires the horizontal interest’s claim to any part of the series’ share of the interest and fee cash flows for any interest payment date to be subordinated to “all accrued and payable interest *and principal due* on the payment date to more senior ABS interests.

➤ The reference in clause (3) to “principal due” would preclude virtually any subordinated interest from qualifying for the special horizontal interest option.

➤ In the great majority of master trust structures, interest and fee cash flows are applied to pay interest due, to pay servicing and trustee fees, and to cover loss amounts allocated to the investor interests, but may not otherwise be available to make any principal payments due.

➤ Instead, principal cash flows are applied to pay principal due on the investor interests.

➤ In addition, the requirement that the horizontal interest have the most subordinated claim to principal repayment cash flow is already addressed in clause (4) of § __.5(f).

➤ **Requested Action:** We believe, therefore, that the reference to “principal due” should be deleted in clause (3), which would also conform to the description of clause (3) that appears in the Supplementary Information.

Other Important Changes to Make the Rule More Workable Across the Master Trust Market

4. Standard Horizontal Risk Retention Option: Not Viable for Revolving Master Trusts

- Master trusts cannot comply with the requirements of the standard horizontal risk retention option in § __.4.
- The comparison of the closing date projected cash flow rate to the closing date projected principal repayment rate does not work for master trusts or any revolving structure.
- During revolving periods, principal collections are reinvested and no principal payments are made, while finance charge collections are applied, interest payments are made, and excess spread is distributed. As a result, no residual or interest-bearing horizontal interest could satisfy the required projected cash flow comparison.
- In the case of de-linked master trusts, subordinated tranches of a series may be paid principal prior to later-maturing more senior tranches of the same series. As a result, it is unlikely that such an interest could satisfy the required projected cash flow comparison.
- In addition, as detailed in SFIG's comment letter, the difficulties with the projection and certification requirements for eligible horizontal residual interests (EHRIs) are particularly acute for master trust sponsors, since a sponsor cannot know the composition of its assets and liabilities on any future date.

4. Standard Horizontal Risk Retention Option: Not Viable for Revolving Master Trusts (cont'd)

- Clause (2) of the EHRI definition requires that shortfalls reduce amounts paid to the EHRI before amounts paid to any other ABS interest are affected. Under the proposed rule, the sponsor's residual interest in excess spread appears to be an ABS interest and, with its first-loss position, it appears that it would need to qualify as an EHRI and satisfy the other requirements applicable to EHRIs in § __.4 before any other subordinated tranche or class of ABS interests could qualify. And yet, as acknowledged by the Joint Regulators, such a residual interest in excess spread cannot satisfy these requirements.
- In addition, as drafted, the EHRI definition does not contemplate or accommodate series-level allocations of collections and related distributions.
- **Requested Action:** The special horizontal risk retention option for master trusts should be revised as set forth in SFIG's comment letter to accommodate the additional forms of horizontal risk retention already used in the market.

5. Special Horizontal Risk Retention Option for Master Trusts: More Forms Already Used in the Market Should Qualify

- Clause (3) in § __.5 requires the qualifying horizontal interest's claim to any part of the series' share of the interest and fee cash flows for any interest payment period (i) to be subordinated to interest and principal due on the payment date to more senior ABS interests in the series and (ii) to be further reduced by the series share of losses.
- Depending on how the Joint Regulators intended that clause (3) be construed, as drafted, it may preclude most interest-bearing subordinated investor interests retained by the sponsor or its majority-owned affiliates from qualifying for the special horizontal interest option.³
- As drafted, the special horizontal interest option would not give credit for horizontal interests issued in one series that are subordinate to investor interests issued in one or more other series, including horizontal interests issued by a legacy trust that are subordinate to investor interests issued by the related issuance trust.
- Clause (4) in § __.5(f), which requires the qualifying horizontal interest to have the "most subordinated claim to any part of the series' share of the principal repayment cash flows" needs to be clarified for de-linked master trusts.
- **Requested Action:** The special horizontal risk retention option should be revised as set forth in SFIG's comment letter to accommodate these additional forms of horizontal risk retention already used in the market.

³ It is unclear whether the Joint Regulators intended that clause (3) prohibit a horizontal interest from receiving any share of interest and fee cash flows before using those cash flows to cover current loss amounts allocated to the series.

6. Proportional Credit for Retained Horizontal Interests Based on the Relative Size of Each Series

- Credit for retained horizontal interests is available to master trusts only if the sponsor maintains a specified amount of horizontal risk in *every* series issued by the master trust, but we believe the desired alignment of interests between the sponsor and other ABS investors can be achieved regardless of whether the sponsor retains the same percentage interest in each series.
- Each series issued by a master trust is supported by one or more common pools of collateral, and so the fact that a sponsor retains exposure to that collateral through one series versus another should be irrelevant, so long as the aggregate exposure, based on the relative size of each series, represents 5% of the total principal amount of the related outstanding investor interests.
- **Requested Action:** We request that sponsors receive proportional credit for horizontal interests retained based on the relative size of each series, regardless of whether the sponsor holds a minimum percentage of each series.

7. Valuation of Horizontal Interests in Master Trusts

The Joint Regulators propose that the seller's interest be measured on a face-value basis – because sponsors of master trusts do not issue senior interest-only or premium bonds in their ABS structures – but posit that a subordinated seller's interest or a horizontal interest in a master trust be measured on a fair-value basis.

- As noted by the Joint Regulators, “a fair value determination [for seller's interests] would create additional complexity and costs, especially given the frequency of the measurements required.”
- A fair-value determination for subordinated seller's interests and horizontal interests would likewise be burdensome, especially if master trust sponsors are required to perform such calculations monthly on every seller's interest measurement date, or to re-value previously issued ABS interests on each closing date.
- Moreover, for a master trust that does not monetize excess spread, a retained interest in 5% of the securitized assets represents at least 5% of the credit risk of those assets regardless of whether the retained interest is *pari passu* or subordinate to other ABS interests.
- The fair value of a subordinated seller's interest or a subordinated horizontal interest will reflect the increased potential for losses, and may reflect that the subordinated interest will be paid at a later date than senior ABS interests, but this does not reduce the sponsor's “skin-in-the-game.”

7. Valuation of Horizontal Interests in Master Trusts (cont'd)

- **Requested Action:** We believe that a face-value measurement should be the valuation standard for all forms of the seller's interest as well as for retained investor ABS interests, so long as the master trust does not issue premium or interest-only bonds and does not otherwise monetize excess spread, and the sponsor or a majority-owned affiliate retains the residual interest in excess spread.
- We believe that a fair-value measurement would be appropriate in the case of a residual interest in series-level excess spread. However, given the complexity of valuing excess spread, we believe that most sponsors will elect not to claim credit for such interests. We are generally comfortable with this result, so long as the final rule allows sponsors to disregard their residual interest in excess spread and still receive credit for other horizontal interests that it retains.

8. Measurement Dates for Seller's Interest and Combined Risk Retention Options

- We generally believe that it is appropriate to measure the seller's interest monthly and that such a requirement would not be burdensome given market practice and the ease of the calculation.
- For purposes of the option to combine the seller's interest with series-level horizontal interests, it is unclear whether the Joint Regulators intended sponsors to calculate the fair value of each horizontal interest on a monthly basis.
- If our request to measure horizontal interests on a face-value basis is adopted, it should be possible for a sponsor to recalculate the offset to the seller's interest with relative ease on a monthly basis.
- If, on the other hand, a sponsor were required to measure horizontal interests on a fair-value basis, requiring a recalculation on a monthly basis would be extremely burdensome and would be inconsistent with the requirements for EHRIs under the standard risk retention option.
- In addition, a sponsor should not be required to increase its risk retention for a series to the extent the horizontal interest declines in value (whether face value or fair value) after the closing date for that series, as this would effectively require the sponsor to hold a greater than 5% retained interest in the securitized assets.
- **Requested Action:** If our request to measure horizontal interests on a face-value basis is not adopted, and if the Joint Regulators determine that a re-valuation of horizontal interests is required, either monthly or on each new issuance date, we request that the alternative valuation method outlined in our comment letter – using the “invested amount” of the related ABS interest – be adopted.⁴

⁴ The “invested amount” of an ABS interest refers to its outstanding principal amount as reduced by write-downs for losses.

Application of Credit Risk Retention Rule to Revolving Master Trusts

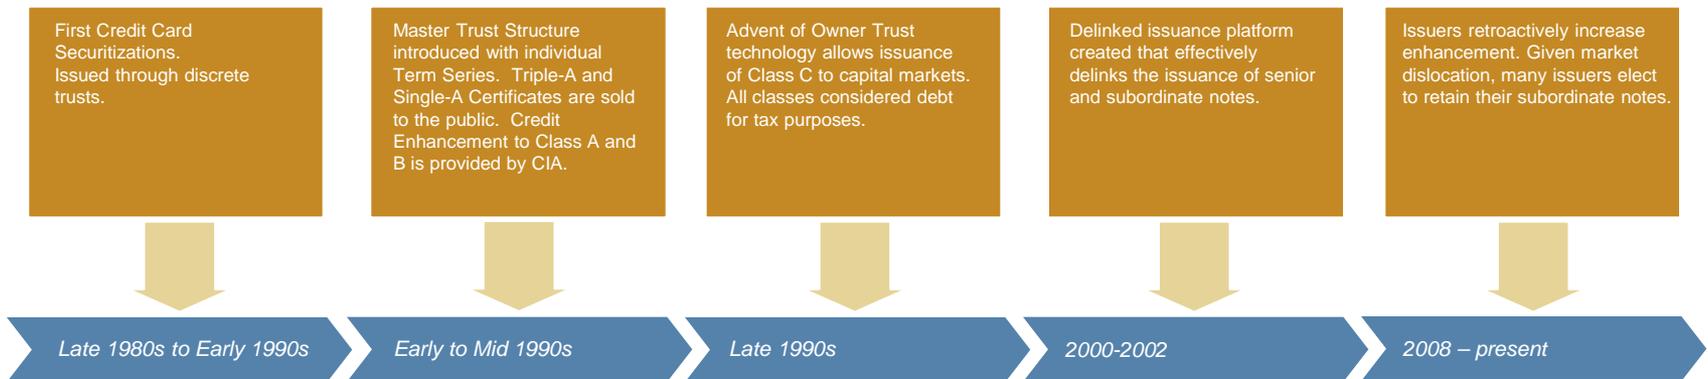

Appendix

December 16, 2013

Evolution of Term Credit Card ABS Structures

Credit Card ABS structures have evolved in response to investor preferences and increasingly efficient funding strategies.

Evolution of credit card ABS structures

- The US credit card ABS market dates back more than 25 years.
 - While the formative years are characterized by the use of discrete trusts, by the early 1990s most sellers had adopted the master trust as their funding platform.
 - With greater market maturity came greater innovation in terms of master trust technology, most notably in ‘publicizing’ the subordinated Class C securities.
 - Such development culminated in the creation and broad implementation of the delinked structure in the early 2000s.
- Currently, the majority of issuance is from Delinked Series issued out of Owner Trusts.

CCABS Structure Evolution: Stand-Alone Trusts

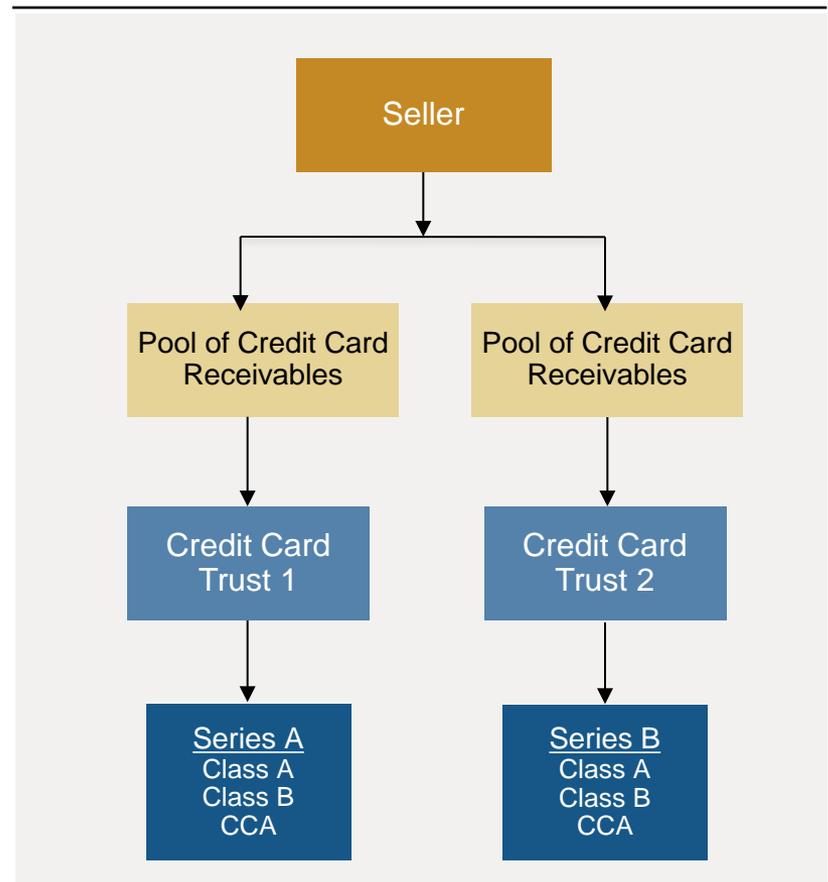

From 1987-1991, the stand-alone trust was the dominant issuance vehicle employed by credit card ABS issuers.

In a stand-alone trust, the originator designates a group of credit card accounts and transfers the receivables arising from time to time in those accounts to a trust that then issues a discrete series of ABS, although there may be several classes within that series.

When the originator intends to issue another series of ABS, it designates a new group of credit card accounts and transfers the receivables arising from time to time in those accounts to a separate trust.

This structure proved cumbersome and not cost efficient. It was used until 1991 when the master trust became the preferred vehicle.

Stand-Alone Trust

CCABS Structure Evolution: Master Trusts

Master Trust technology became the market standard in 1991.

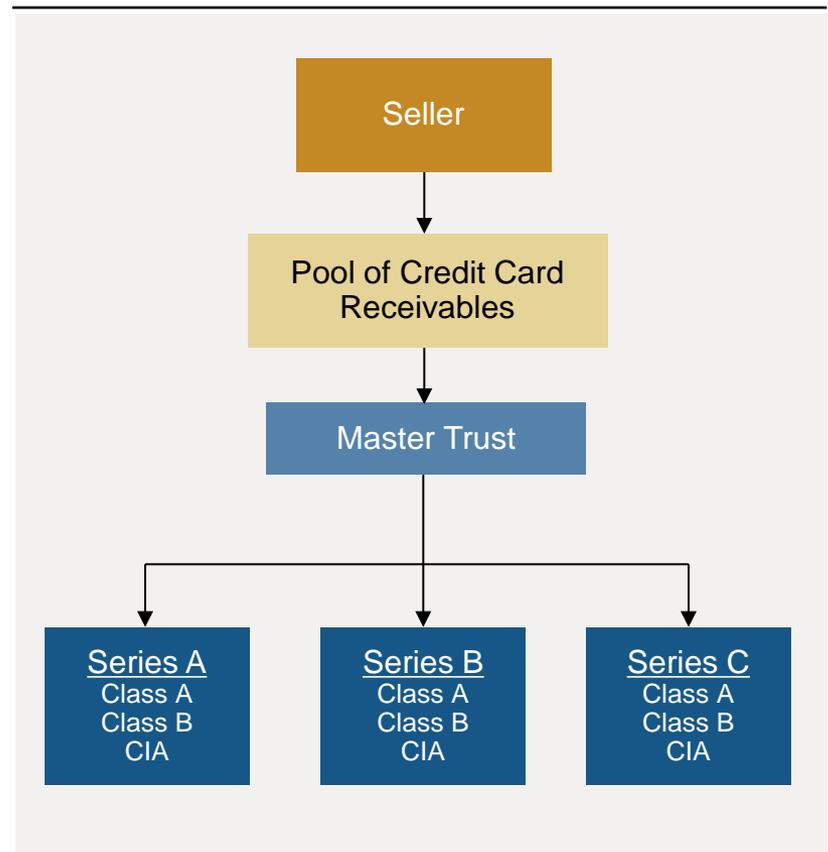

Credit card transactions involve the sale of pro rata shares in a revolving pool of assets.

- Receivables are not segregated to support a certain series.
 - Security holders have an undivided interest in the aggregate pool of receivables.

Multiple series of ABS are issued and can be issued at different times with different liability characteristics: tenor, fixed/floating coupon, etc., all from the same collateral pool.

The most subordinated tranche in the capital structure is usually in the form of a loan, referred to as a “collateral invested amount” (“CIA”), which serves as enhancement to more senior tranches.

Master Trust

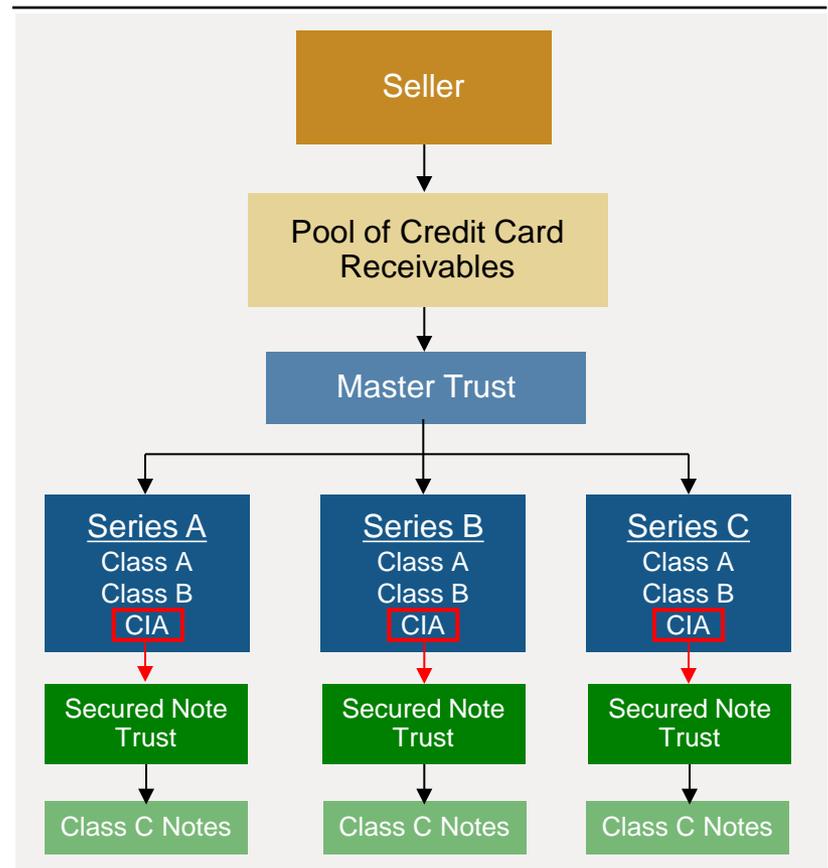

CCABS Structure Evolution: Master Trust/Secured Note Structures

In 1998, issuers developed a structure that allowed them to sell the most subordinate tranche, referred to as Class C notes:

- A secured note trust was created for each series, backed by a collateral certificate representing an interest in the CIA.
- This secured note trust would issue Class C notes secured by its interest in the cash flows allocated to the CIA.

Master Trust/Secured Note Trust

CCABS Structure Evolution: Master Note Trusts

Credit Card Master Note Trust (“MNT”) technology builds on the traditional Master Trust structure.

In the traditional Master Trust, securities created took the form of certificates, which evidenced ownership in the assets of the Master Trust.

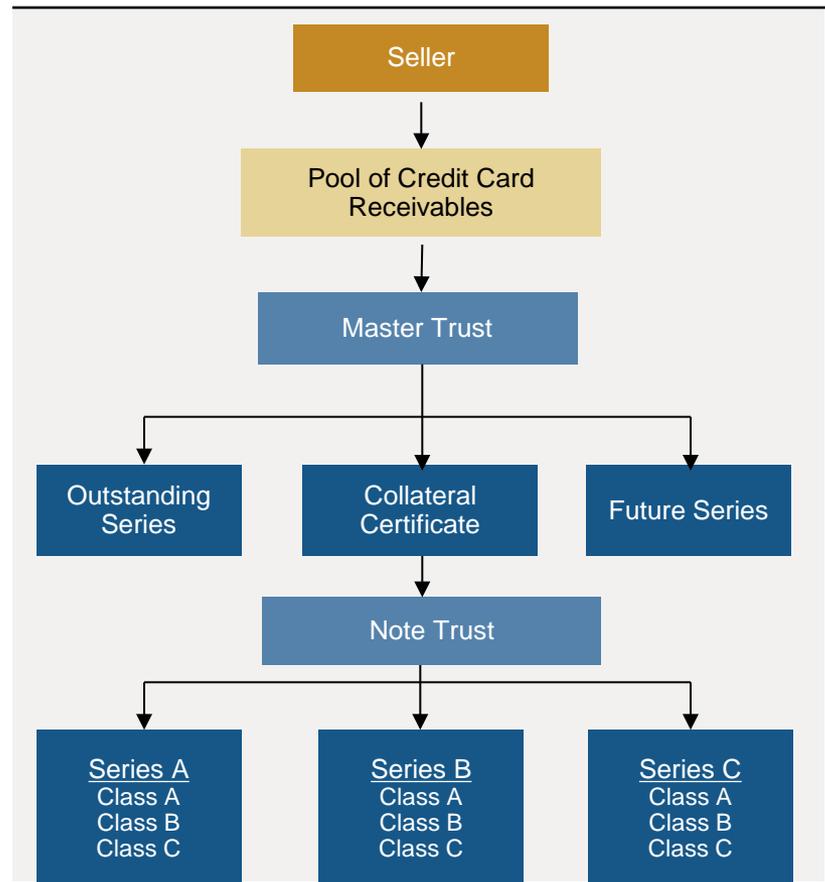

- The key innovation of the MNT was the change in form of issued securities to that of notes, which evidence debt of the trust secured by the conveyed assets.

The MNT, as a business trust, allows for issuance of multiple series of securities backed by a common pool of revolving collateral.

Securities issued are characterized as debt-for-tax and, therefore, ERISA eligible.

The MNT can issue series of ABS with flexibility in tenors depending on issuer's liquidity needs coupled with investor demand.

Master Note Trust

CCABS Structure Evolution: De-Linked Structures

The newest technology used for credit card securitization is the De-Linked Issuance Trust, featuring MTN and “De-linking” tranche technology.

The main feature of the structure, “De-linking”, allows each tranche of notes to have an independent maturity schedule.

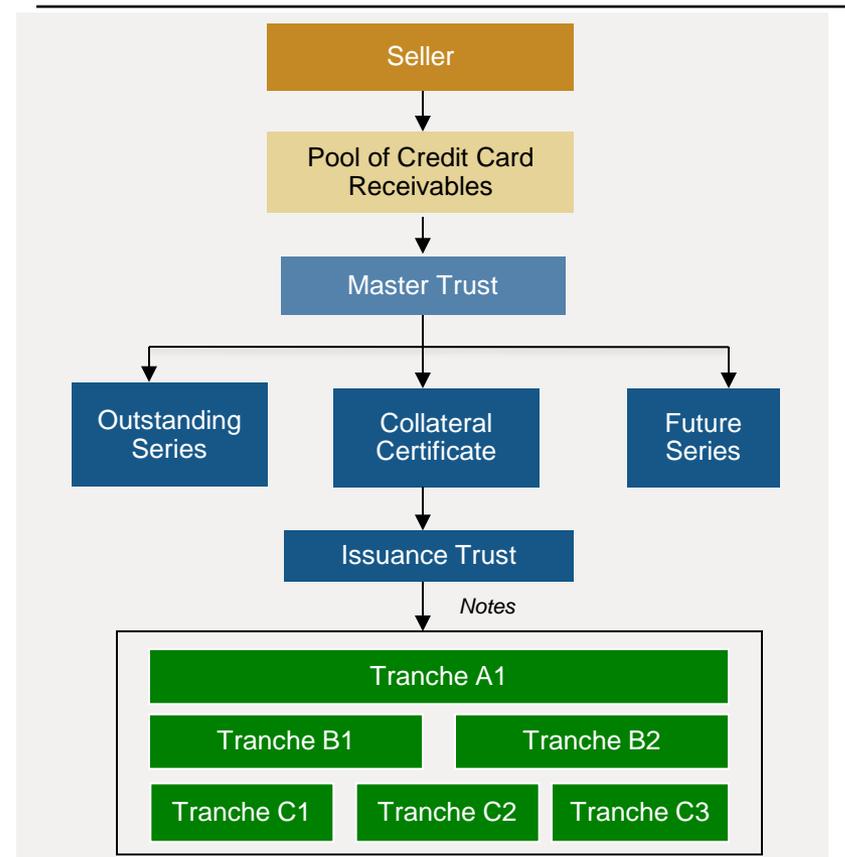

- The subordinated tranches of notes no longer need to be linked to any senior tranche of notes.
- This feature allows issuance of different tranches of notes at different times based on demand or need.

Strict issuance tests ensure there is sufficient enhancement beneath each class.

Issuers tend to over-fund subordinate tranches to allow flexibility to optimize issuance of senior tranches.

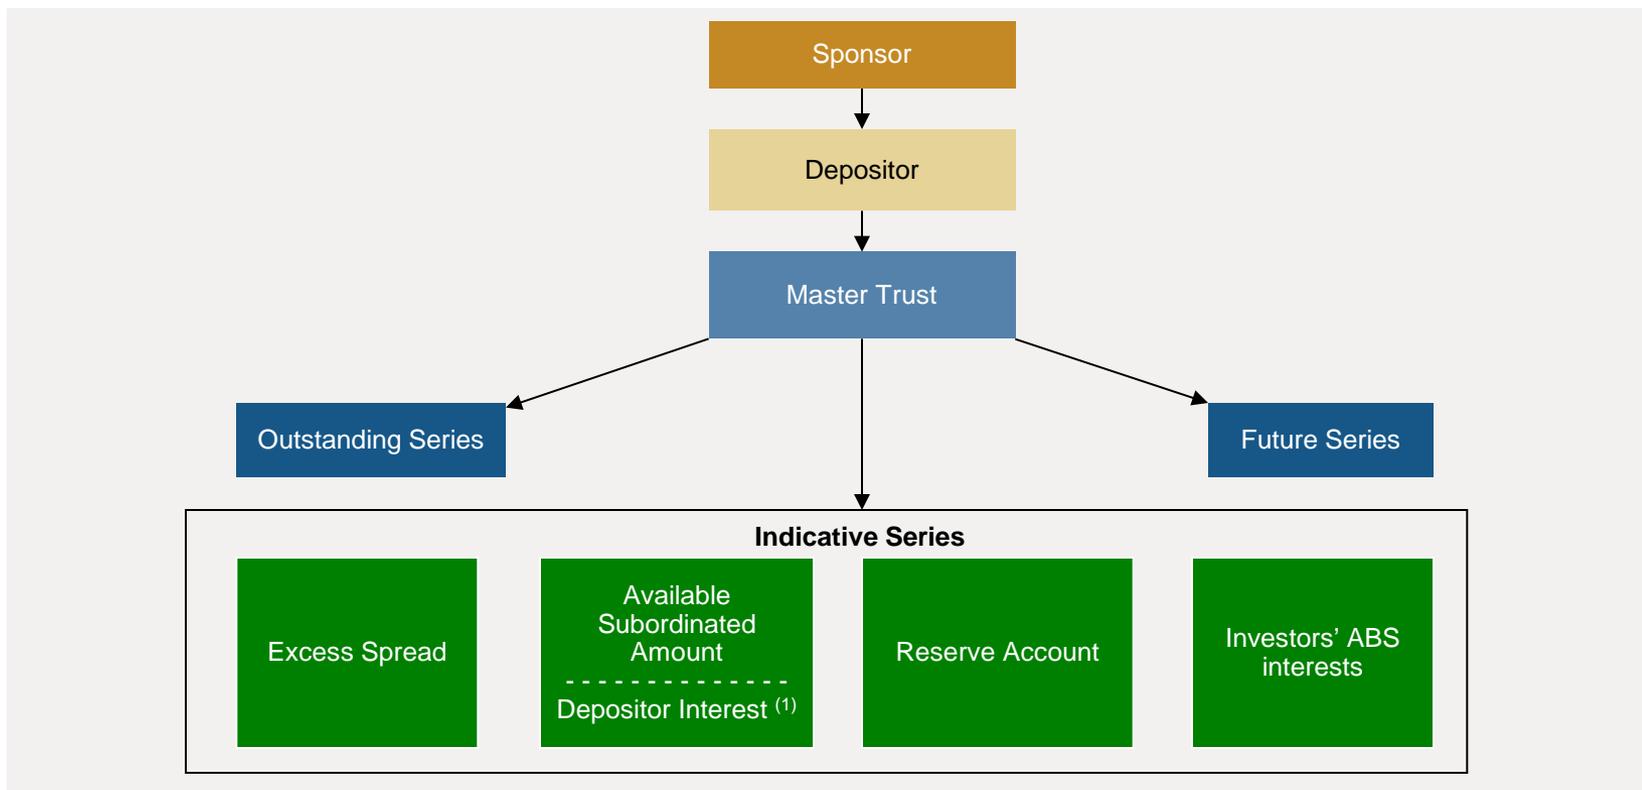

As the credit crisis pushed credit spreads on subordinate notes wider than many credit card banks alternative sources of funds, many issuers have elected to issue and retain the subordinate notes.

“De-Linked” Issuance Trust

Example of Typical Floorplan Securitization Structure

The following diagram provides a simplified overview of the structure for a typical floorplan master trust securitization and the enhancement available for an indicative series issued by a floorplan master trust.

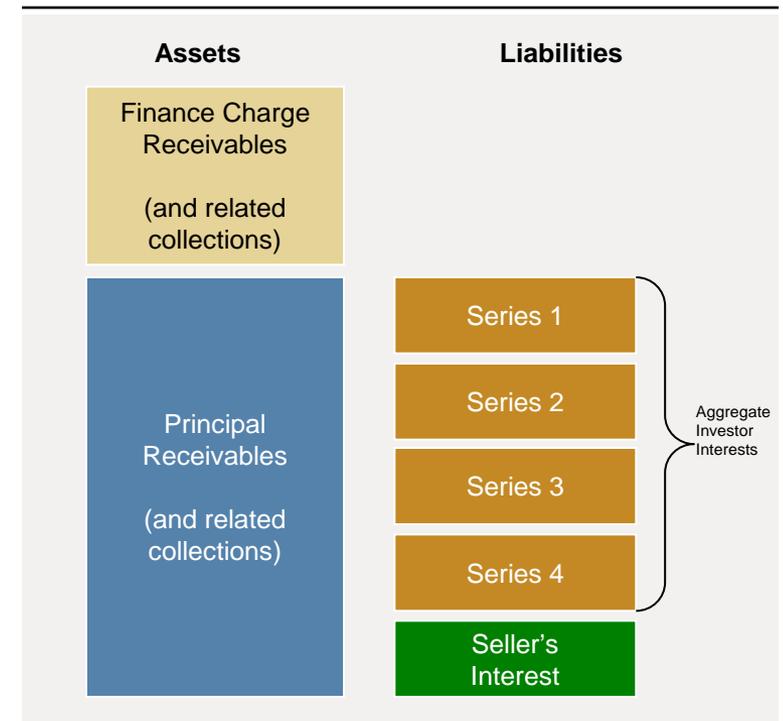

(1) The depositor interest represents the interest in the trust assets not allocated to any series. A portion of the depositor interest equal to the available subordinated amount is subordinated to the investors' ABS interest.

Investor Interests and Seller's Interest

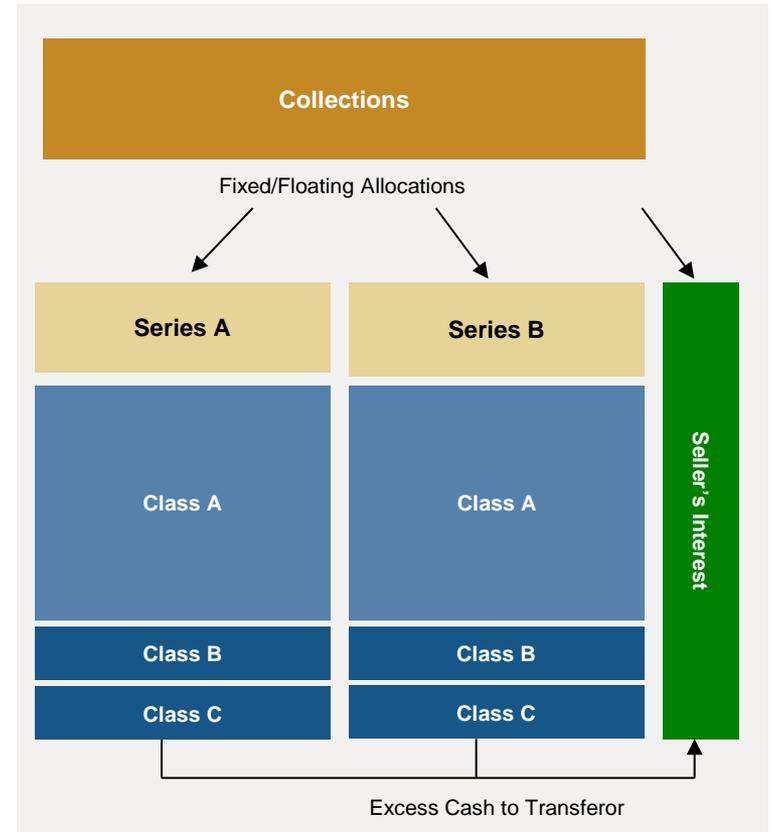

- The receivables and other assets held by the master trust at any time are allocated between the investor interests and the seller's interest.
- The investor interests equal the aggregate interest of each series of ABS issued by the master trust from time to time and represent a proportional share in the assets of the master trust.
- The securitizer is required by the governing program documents to maintain a minimum pool balance in excess of the aggregate investor interests.
- The seller's interest equals the amount of this excess and, like the investor interest, represents a proportional share in the assets of the master trust.
- The seller's interest is issued at the time of the original transfer of receivables to the master trust and fluctuates in size over time as new receivables are added, others are paid, and new series are issued or mature.

Credit Card Trust

Allocations Between Investor Interests and Seller's Interest

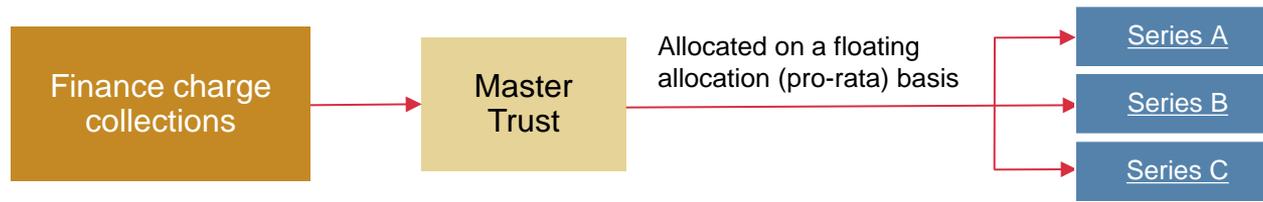

- Finance charge collections, principal collections and loss amounts associated with charged-off receivables are initially allocated between the aggregate investor interests and the seller's interest.
- During revolving periods, virtually all master trusts allocate collections and loss amounts between the investor interests and the seller's interest on a pro rata basis, using a floating allocation percentage.
- During other periods, including scheduled principal accumulation or scheduled principal amortization periods, virtually all master trusts fix the allocation of principal collections to the relevant investor interests at the higher levels applicable before principal payments begin.¹
- This fixing of allocations of collections to the investor interests provides for the orderly and timely payment of the investor interests, by deferring a full allocation of collections to the seller's interest when a series, class or tranche of investor interests is in any form of principal accumulation or principal amortization period.
- Excess cash flows not required by the outstanding series are paid to the transferor in the form of excess spread.

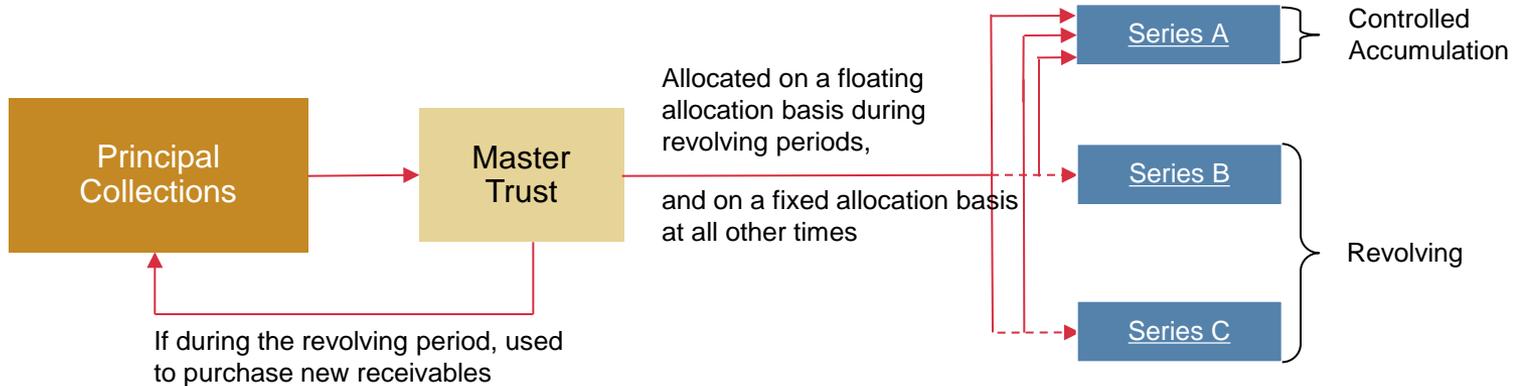

¹ By comparison, the allocation of losses between the investor interests and the seller's interest remains pro rata at all times.

Allocations Among Investor Interests

Finance charge collections are used to pay bond coupons and servicing fees, and to cover loss amounts.

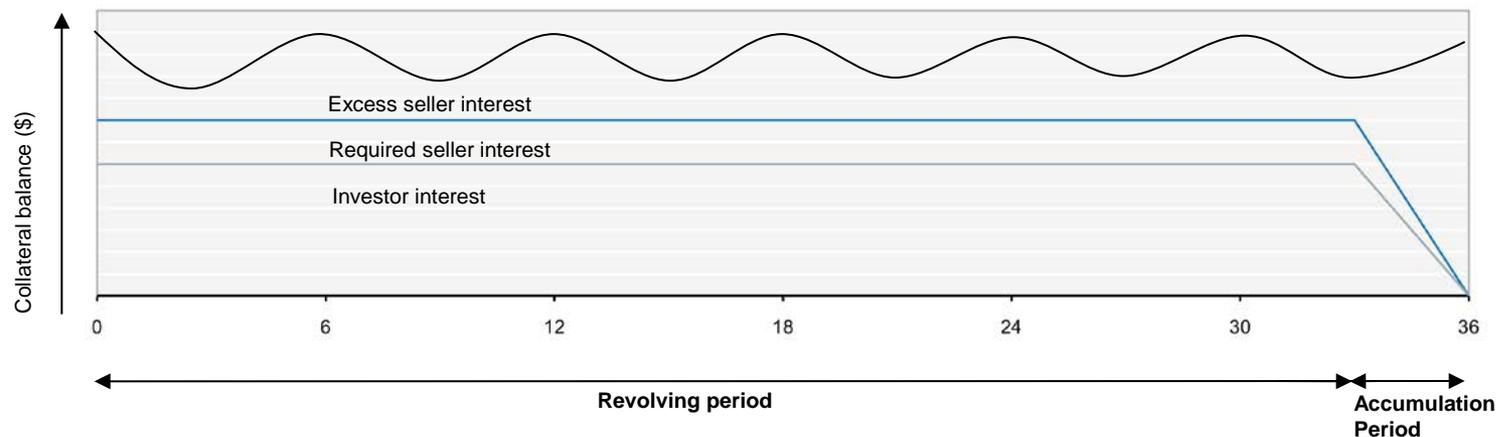

Principal collections are used to pay bondholders when principal is due; otherwise it is used to purchase new receivables.

Investor Interests and Seller's Interest: Soft Bullet

Collateral: Credit card accounts, monthly principal and interest receipts

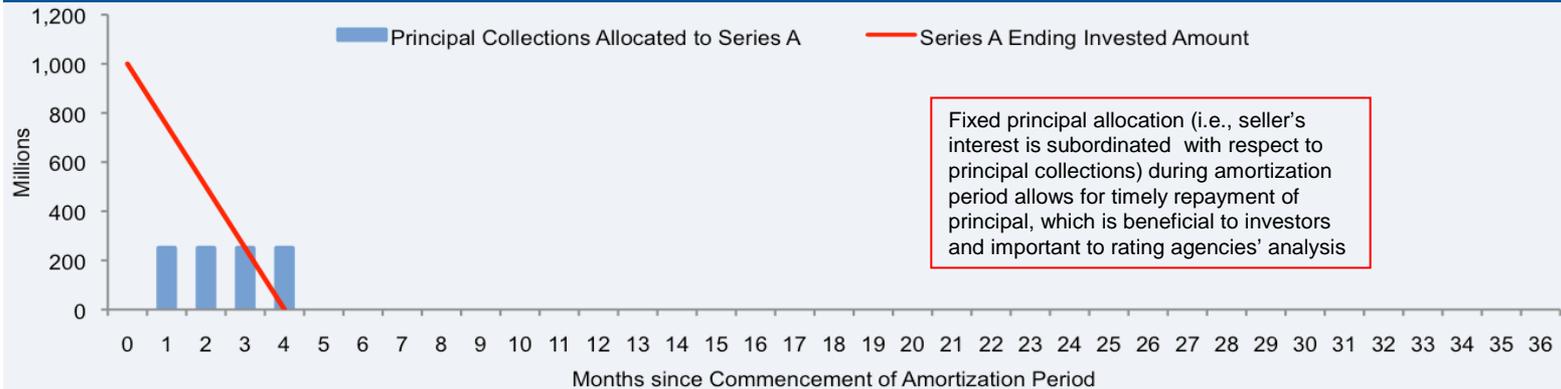

- The primary benefit of the seller's interest is that it provides a cushion as the first tranche to serve as a buffer against seasonal fluctuations in the portfolio and to absorb dilutions (returns).
- Many trusts actually require a minimum seller's interest for protection from dilutive items.

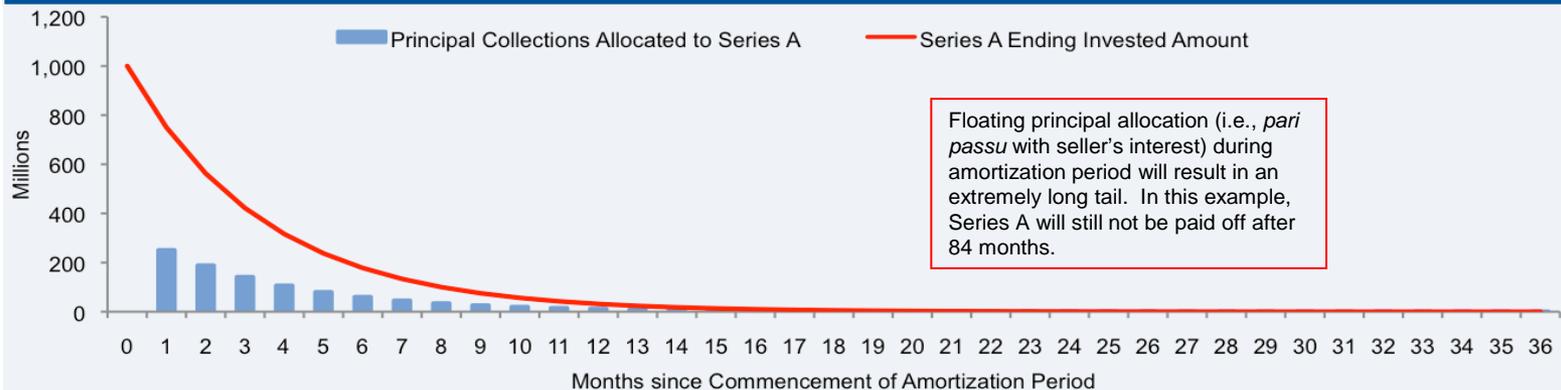

Fixed vs Floating Principal Allocation

- Assumptions:
 - Trust Receivables Balance: \$5bn
 - One series (Series A) outstanding
 - Initial Series A principal balance: \$1bn (i.e. Allocation % at the beginning of Amortization Period is 20%)
 - Monthly Principal Payment Rate: 25%

Example 1: Fixed Principal Allocation during Amortization Period

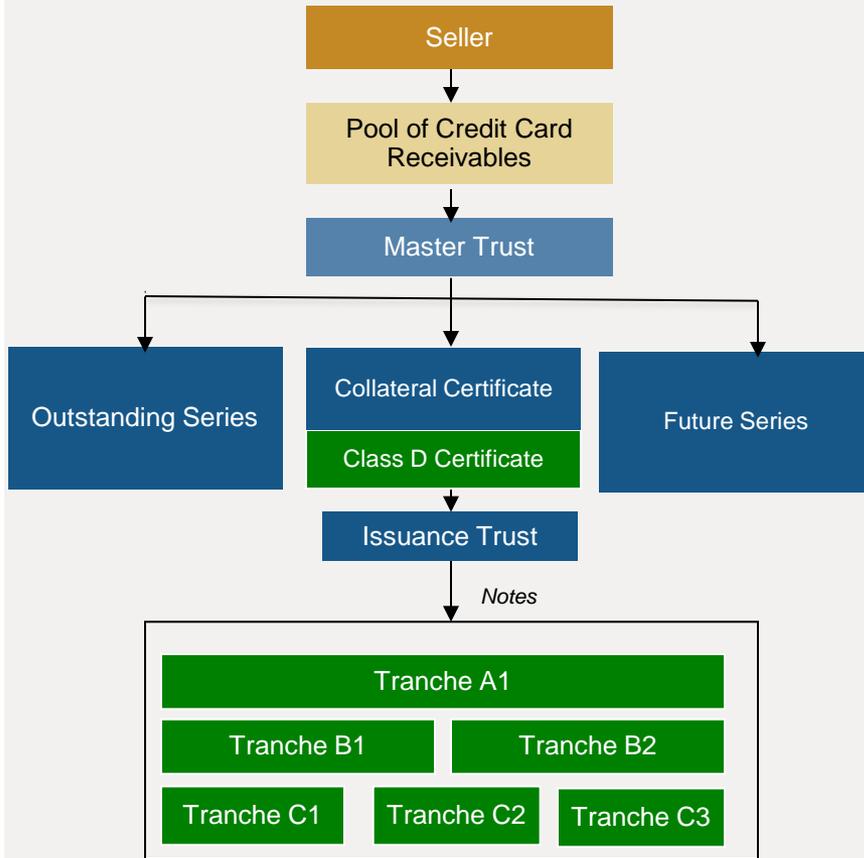

Example 2: Floating Principal Allocation during Amortization Period

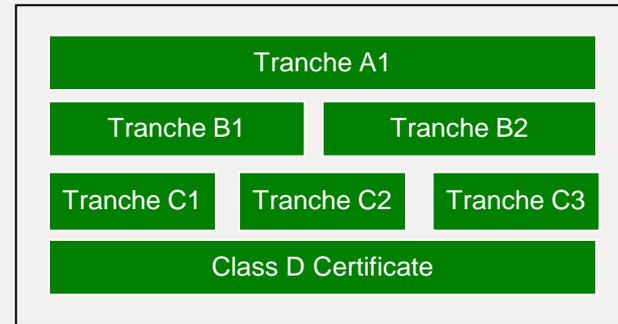

Example of Horizontal Interest Issued in One Series That is Subordinated to Investor Interests Issued in One or More Other Series

“De-Linked” Issuance Trust

Credit Enhancement Structure

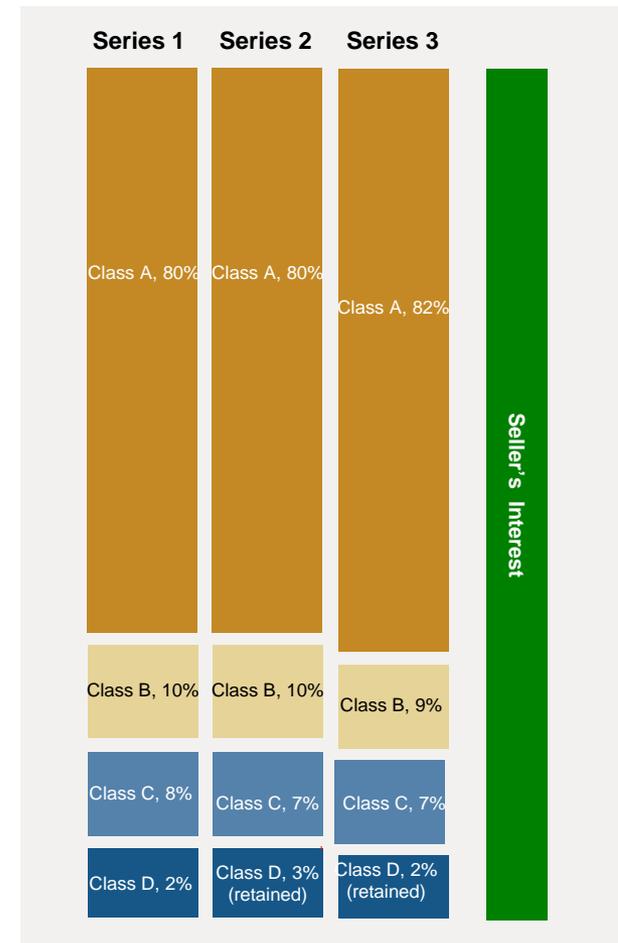

Credit for Horizontal Interests on a Proportional Basis

- Three outstanding series, each having an outstanding principal amount of investor interests equal to \$100.
- The sponsor does not retain any horizontal interest in Series 1, retains a Class D horizontal interest in Series 2 representing 3% and retains a Class D horizontal interest in Series 3 representing 2%.
- The sponsor should be permitted to reduce the 5% trust-wide risk retention requirement by 1.67%, by weighting the amount of horizontal interest retained by the respective outstanding principal balance of the investor interests of the related series, as follows:

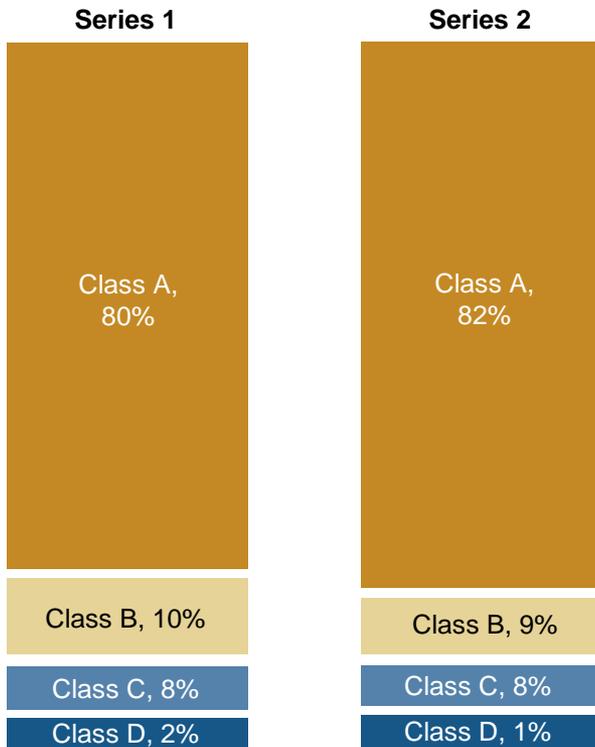

Series	Retained Horizontal Interest		Principal Balance of Investor Interests		Offset to 5% Trust-Wide Requirement
1	-0-		\$100		
2	3%		\$100		
3	2%		\$100		
Total	5%	÷	\$300	=	1.67%

- Upon the maturity of any series in which the sponsor retained a horizontal interest that offset the 5% trust-wide requirement, the sponsor would be required to either retain a qualifying horizontal interest in a new series or increase its trust-wide seller's interest requirement, in either case, by an amount sufficient to again satisfy the 5% aggregate requirement.

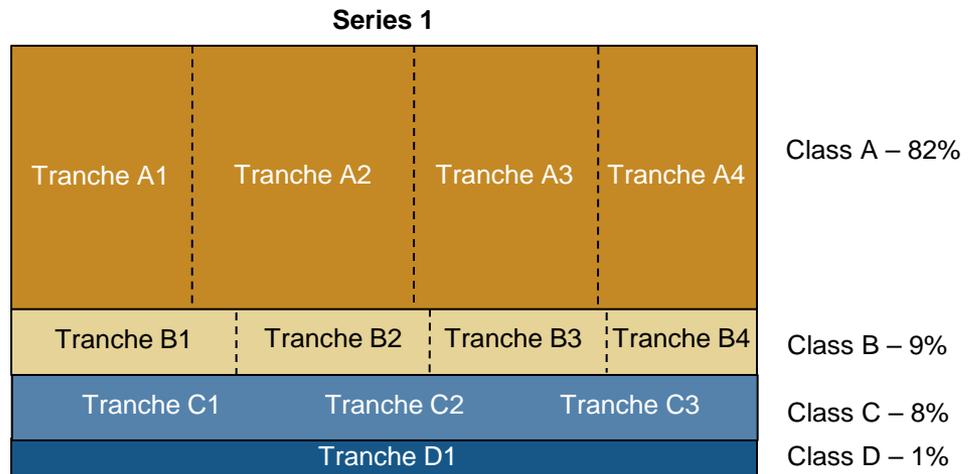

Linked vs De-Linked Structures

Traditional “Linked” Master Trust

De-Linked Issuance Trust

De-Linked Issuance Trust: Example of Credit Enhancement

Example for \$1,300MM of financing:

Class A Required Subordination designation as:

5.00% Class B notes (\$50)

5.00% Class C notes (\$50)

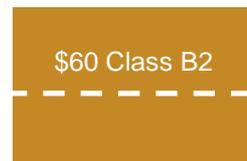

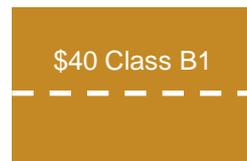

7.50% Class D notes (\$75)

Class A Excess Enhancement:

Class B notes (\$50)

Class C notes (\$25)

Class D notes (\$50)

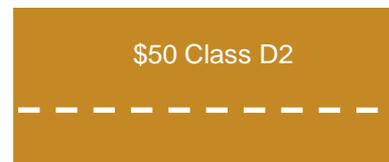

\$50 available enhancement

\$50 excess enhancement

\$50 available enhancement

\$25 excess enhancement

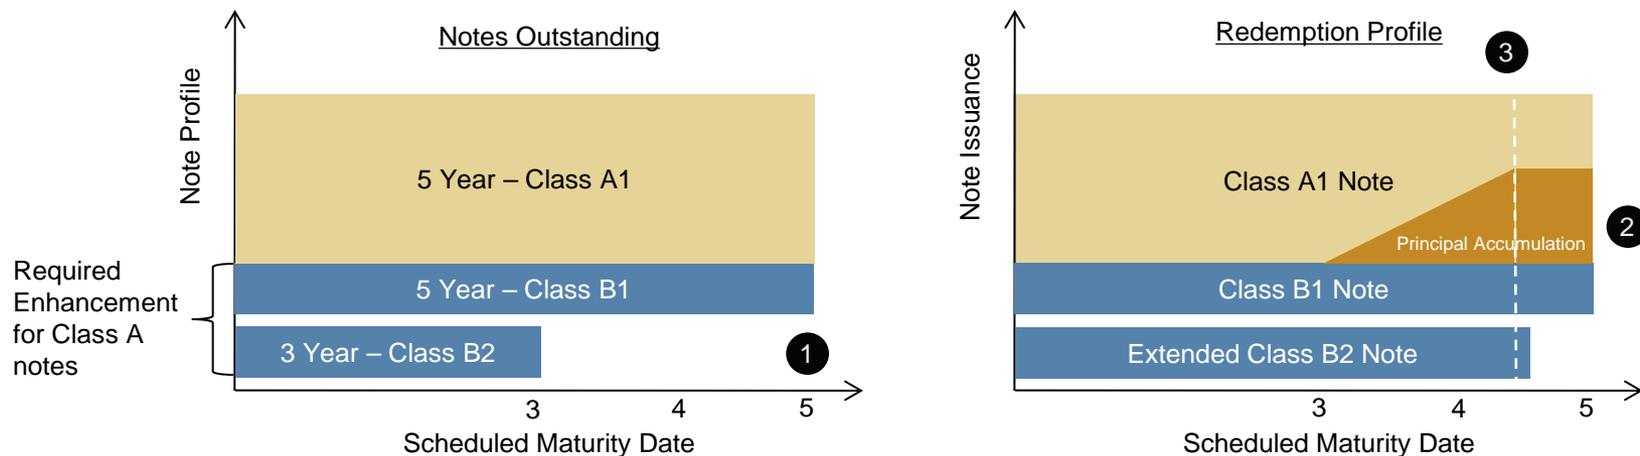

\$75 Class D Available Enhancement distributed pro rata across Class D1 and Class D2 notes

The remaining \$50 of Class D notes is not available for enhancement for Class A1 notes

Excess Class D notes may be used as enhancement for new Class A, B, and C tranches

De-Linked Issuance Trust: Subordinate Note Extension

The extension scenario illustrated below assumes that two Class B notes of equal size provide credit support to a single Class A1 note. Under this scenario, the shorter-dated Class B2 note is unable to be refinanced at its scheduled redemption date of 3 years.

- ① The Class B2 note is unable to be refinanced at its scheduled redemption date in year 3, which leads to:
 - Extension of the Class B2 note past its scheduled redemption date.
 - A requirement to begin trapping principal to effectively cash collateralize the Class A1 note.
- ② Principal is trapped in a principal funding account to effectively reduce the Class A1 Investor Interest to a level where the Class B1 note alone would provide sufficient credit enhancement.
- ③ Once sufficient principal has been trapped the Class B2 notes can be repaid in full.
